Nice '29 Hartley picture. It's like seeing the name of your hometown on the highway exit sign ... yeah, this looks like a good place to stop.

Coop, AA1WW

3. Thank you for starting this group!

Gentlemen,

Thanks for starting this group and approving my membership. I look forward to sharing info and ideas and gaining knowledge about the hobby here.

73,
Joe N2OUV

4. Early Transmitter/Receiver

Yahoo group: AWAGroup (2010 — 2011)
Date: 2010-02-05 04:51:12 UTC
From: Mike Feher
Topic: 4 Message: 4

When I get back home I want to take some photos and post them of a real neat early transmitter and receiver that I have. I still do not know if it is homemade, or, commercial, but it sure does look commercial to me. The top deck is the transmitter and I have a pair of Arcturus blue 45s in there. Nice large copper tubing coil. The bottom deck is the receiver and I have three blue Arcturus 01As in there. The set is really neat. Possible some of you may have seen it at one of the AWA meets as I did enter it in a contest and won a ribbon with it. I forget the year, or, the color of the ribbon, HI. However, it was probably about 11 years ago, so, it may be mentioned in a back issue of the OTB. It covers 80 meters just great, and, other than playing with it on the bench, I never had it on the air. It would be ideal for the 1929 QSO party. So, you will all just have to wait a week or two till I get home and get a chance to take the photos. Also need to clean it a bit, since the fogging they used to kill the mold after the flood in my basement (ruptured water heater), left a residue on everything. So, for now, just anticipate salivating, because I am sure once you see the photos you will for sure. This is the rig John Dilks wanted to buy from me for $1000 a few years back and has been badmouthing me ever since for not selling it to him. He claimed to have wanted it for one of his articles in QST. I offered to loan it to him, but, of course, that was not good enough.

It will be interesting to see how much cross pollination we will get as the group grows, between our reflector and "Ron's".

Hi Mike,

Those attachments your seeing are the little html Yahoo graphics that are probably being attached because your group setting has "html" selected. If you sign in to your Yahoo account and then visit this group you will see their is a means to edit your account setting for this group. If you select "text" only for the emails those attachments should disappear, but then you wouldn't see *BOLD *or /Italic/ or _Underlined_ text in submitted messages. Even with html I think the moderator might have the ability to allow us to include pictures right in our posts.

Test of a posted picture below (my Parmater TGTP 1928 transmitter):
IF YOU SEE THIS TEXT MY PICTURE WASN'T ALLOWED or you have TEXT selected.

I look forward to your pictures on your rare transmitter/receiver setup. Since you had it at an AWA conference have you traced out the circuits to see what type of oscillator the transmitter was based on and if the receiver was a regen or a TRF? it will be interesting based on the circuit topology to see if this is a pre or post 1925 design. The pictures will also help me to determine the year based on specific components being used and when they first came out. The 45's are late twenties naturally.

Looking forward to your pictures es 73

Hey gang,

It appears that pictures can't be included in submitted emails as it is currently set. I did create an album for my Parco (Parmater) TGTP transmitter. This is an original 1928 transmitter out of Charlotte, Michigan and most likely the only one in existance. It was originally owned by Alan Stoddard and once was on display at the AWA conference many years ago. Alan brought a really nice Aero transmitter clone he built to the AWA conference around 2005 or so. Alan's health was getting the best of him unfortunately and he has since moved to a nursing home. I got the transmitter when they were selling off some of his stuff. It was the only ham radio related item I saw so I have no idea what happened to his Aero clone transmitter.

The Parco is a little different than the QST TGTP transmitter circuits in that it uses shunt feed for the high voltage on the plate. I've had it going but wasn't able to get more than 1/2W out. This past 29 QSO Party it was going into run-away oscillations. I'll need to do some more work to get it going as it should be. The magazine ads shows one light bulb socket right behind the front panel. My guess is they used the front potentiometer and that light bulb together to make the DC return path in the filament circuit. I've never seen that done before. I've seen a center-tapped resistor (or two resistors), two light bulbs or the tapped filament transformer, but never something like this combination. The light bulb socket was removed in my transmitter so I just used a tapped filament transformer in my tests. If you have any other ideas about what might have been original I would love to return to a period light bulb socket and bulb.

I don't think Alan ever had it running, although I beleive he did refurbish it. The grid leak cap was not wired across the grid leak resistor and thus it never would have transmitted in the configuration I received it in.

In general, I do not believe attachments will make it into the archived messages or the message "digests" for those they may choose "Daily Digest" as their preferred delivery mechanism (that's one of the choices you can make when you click on the "Edit Membership" link on the top of the group page. Of course, you have to be logged into your Yahoo account to do that). Member who choose "Individual Emails" will see the attachments if they allow for HTML-formatted email.

The moderator can turn on a group setting that will archive attachments into a group repository visbile as a link in the left hand pane on the group page (i.e. "Attachments"). I'm not sure if this actually works 100%. I'll mention it to the moderator.

The group "Files" and "Photos" repositories are effective and user of many group will post a message with information about their rig and which folder in the photos or files section it is in. I believe any logged-in group member can create a folder in "Files" or "Photos". I think moderator may be able to effective "sticky" folders that always show at the top of the list. This is good for introductory and summary information such as Frequency-Asked-Question (FAQs), a group glossary, etc.

73's,
Coop, AA1WW

Thanks Lou. Oh I guess the picture did come through. It doesn't appear on the Yahoo website in the message. However, I did note that the group emails are set not to archive attachments. Maybe Bruce can enable that option and we can give it a try until it either gets out of hand and we use up all our assigned storage area to fast. At least right now the pictures will be in the emailed messages, they just won't be saved to the group stored messages.

I did create a album on this transmitter (see my previous message).

20. 1929 and 1930 Stations

Yahoo group: AWAGroup (2010 — 2011)
Date: 2010-02-05 16:31:28 UTC
From: niel_w0vlz
Topic: 20 Message: 20

Lots of times questions get asked about what sort of rig to put on the air as a 1929 station. What were hams really using? Do the back page ads in QST really reflect what was on the air?

I found Bruce Kelley's comments on 1929 equipment in the May 1994 issue. After looking at 60 QSL cards from 1929 and 1930 he concluded that Hartley oscillators and the 210 dominated the transmitter scene and almost 90% of the receivers had no RF stage. I've added to Bruce's QSL card data and posted the summary in my blog at http://w0vlz.blogspot.com/2010/02/1929-and-1930-stations.html .

Anybody have additional 1929 and 1930 QSL card data? I can add it in also.

73, Niel

Hi Niel,

I have a handful of QSL cards here from the 20's & 30's, but only one from 1929, specifically. To whit:

VE2BB 25th July 1929...
XMTR: TGTP 852 (1100 V)
RCVR: 2 Steps

Feel free to add this to your data base, if you can use it...

BTW, when they were still with us, Bruce Kelley and Fred Hammond (VE3HC) both paid me the supreme compliment when they first heard my 245 Hartley transmitter on the air, shortly after I'd built it...each said that my signal did, indeed, sound "...very 1929-ish".

Both were first licensed in that same year, too, as I recall.

Topic: 20 Message: 22

Thanks for the insight into those QSL's Niel. I have a collection of cards, maybe 150 of them from the 1923-1935 period. I should do a spreadsheet summary of receiver, transmitter and antenna based on year. That sure would be helpful. Naturally they are all rare today, but I love the 1920's picture QSL's and any that were local to my QTH area. My most treasured is a 1926 QSL (to 8CXW) from 1XAM/1QP our Mr. John Reinartz ! BTW his transmitter is stated as a 500 watt 204A and what appears to say 385 meters (Lambda Symbol Used) AC??? I'll need to make a detailed scan of this so you folks can interpret the hand writing. The receiver states simply DET & 1 STEP. I also have one from 1AA which states ARRL Radio Experimental in Mexico which is 1925. Still they don't all have to be old, as I've got one that would be of real interest to our New England members and it's from 1952. It's basically the ARRL gang out for Field Day under the call W1EH/1 which was the old K. B. Warner (First ARRL General Manager) callsign. The funny thing is the name of the group "The South Lyme Beer, Chowder & Propagation Society". The operator check off list includes Baldwin, Budlong, Goodman, Grammer etc. Grammer W1DF was the operator for this particular QSL card.

/It will be hard/ but I should take a picture of my top ten vintage QSL's and post them to an album on our group area.
My goal, as is common for some of us 29'ers, is to make a real 29 station setup. I already have the 29 vintage lamp, desk (converted from a dresser), etc. I will place it in an area separate from the other operating positions and the wall will be converted to 1929 with old station license and old QSL's on the wall. I will sprnkle in some of my recent AWA 29 QSO Party QSL's that have been creatively designed to look 1929'ish! The objective is when I'm sitting there using a period regen and transmitter (redesign or original) I'll be carried back to 1929 for a brief period. Oh what a joy! BTW, I cheat now as I've been using more modern receivers and have a 8GHz spectrum analyzer on in the background monitoring my transmitter in my well equipped lab area. Shame on me.....

Topic: 20 Message: 23

I will begin to pull just my 1929 QSL to generate a spreadsheet of equipment. I'm not going to rush as I enjoy reading the cards so much it adds a delay of it own!

One thing I did notice was on a few I discovered a neat way that the operators would describe their Hartley transmitters. They would draw a small heart shape followed by the letters "ley". Now ain't that a unique way. I'll have to remember that next time I send out a QSL when using my Hartley 210 transmitter.

BTW, about 75 of my QSL's were addressed to VE3CL in the 1920's. I remember buying them from a Canadian ham about ten years ago. I would have to see if I can find an archive of those emails on an old backup CD to see where he got them. I don't think he was VE3CL as even ten years ago that would have made him very old. Although I do think he was old! Darn why didn't I document that some place!

Hi Steve,

I'm working right now on scanning my top 10 QSL's. Stay tuned. As a temptation item one of them is the original 8AB QSL (From France) confirming the first amateur two way QSO in 1923 across the Atlantic. This card does appear on the web already but I have the original. I'll also be including a scan of the ten year anniversary note sent to Fred Schnell (1MO the other end of that QSO) from Leon Deloy F8AB which will be a first time for the web or in any form of print!

I should have them posted as an album shortly.

From: Don Buska - The Radio Lab Works
Topic: 20 Message: 28

Well that went faster than I expected. The cards are on display guys.

Some comments on the cards:

Notice the Official Observer (OO) notice from Feb 3rd 1927. The "year" came from the post mark on the other side. 8ABW got a wrist slap for operating on 36 meters. I know many 1929 QSO Party members have gotten OO notices in the past after the event. Why I haven't is simply good (or maybe bad) luck! So your in good company with the original operators from the 1920's if you've earned one of these highly acclaimed cards , hi.

Those who have read about the first Transatlantic Amateur 2-way will remember that Fred Schnell 1MO was credited with being the first on the US side, although our friend John Reinartz was copying Leon Deloy probably earlier and could have worked him first, but the QSO was prearranged with Fred who was the third employee (Communications Manager) of the ARRL. I have a 1MO QSL card from 1928 in this set, but please note this isn't Fred Schnell any longer. Actually a female employee of the ARRL picked up Freds call when he left the ARRL in 1925 and headed back to the Chicago area. Fred actually went to work for Burgess in Madison Wisconsin first before going back to Chicago (his hometown). [Note my QTH of Kenosha WI is near Chicago and we are the last stop of the Chicago commuter train]. So this Harry C. Merry was the second holder of the 1MO call sign after Fred gave it up.

OBTW, if you check the receivers on 1925-1930 QSL's you'll often see them indicate they used a Schnell Tuner. That's a regen receiver based on Fred's receiver design he used for the Transatlantic QSO as well as on the NRRL expedition (no time for that now - but go through your 1925-26 QST's for more info). If you want to read about it it's covered in the article in the 1924-1928 time frame by Kruse. The article covers a bunch of regen designs so the name Schnell doesn't appear in the article title. Also several years back there was an article in QST about another Schnell receiver, but that one is a much later design from the early 30's. I have other original pictures and documents from the 1923 Transatlantic event that have never been published, but I am saving these for an article I intend to write about Fred Schnell. I've been intending to write the article for five or six years now. I need you guys to set a fire under my butt to get me moving - Start motivating, hi.

The W4AGZ picture QSL is hard to read at the bottom. That's not the scan but just fading on the lower half of the QSL after all these years.

Enjoy the cards my friends es 73

I like the choice of name because while it incorporates "awa" it does not suggest an official connection.

I would definitely argue against restricting coverage to amateur radio. Why rule out the interesting questions and comments that would otherwise be coming from the many non hams in our hobby?

I have to agree 100% with Marc on this one. I've been a member of the AWA for a little over ten years now and naturally I've always leaned toward the vintage amateur communication side. However, over these ten years I have learned a great deal from our friends on the BC side of the hobby and many of them have become close. I actually dragged a few over to the ham side kicking and screaming.

I think those of us here are here because of the biases that would always crop up in the past and we have an grand opportunity to make this group a true reflection of the AWA organization at large, even though we have no official connection.

And that's the last I'll say on that topic. Back to vintage radio.

Happy Saturday Lou,

Big Nick sure is a master craftsmen! Check out his Doerle 3-Tube or any of his other projects. He is a master craftsman for sure.
http://www.bignick.net/Morgan_Radio/Radio.htm

Reading his main page <http://www.bignick.net/> it became immediately clear that he was the leader of a local band "Big Nick & the Cydeco's". I've seen them advertised playing at many of the local venues around the Milwaukee and Wisconsin area, including a few events here in Kenosha. Nick lives only a mile away from my Mom's house in Muskego, Wisconsin which is a suburb of Milwaukee and about 45 miles from my QTH.

I'll send him an email and introduce myself and the AWA Group. He appears to be a perfect fit for our activities including the 29 QSO Party.

I'm still a bit confused on the "clever" part of that transmitter plate coil. What am I missing in the text or pictures?

I do need to ask him about where he gets his laser etched front panels done. If he's in that business maybe we will have a connection on making some excellent front panels for future projects too.

Thanks for the heads up Lou.

40. Center-Tapped Filament Xfmr or Taped Resistance

Yahoo group: AWAGroup (2010 — 2011)
Date: 2010-02-07 19:45:13 UTC
From: Don Buska - The Radio Lab Works
Topic: 37 Message: 40

I asked this question several years back and never got a real "technical" answer. I've always wondered why most of the twenties designed self-oscillator transmitter used the tapped resistance across the filament transformer for the DC return vs simply using a center tapped filament transformer. I could never find anything in the old articles or books that explained why either was chosen. That was until the latest article in the AWA Journal by Mike WU2D when he explained the construction of his latest TPTG transmitter. I'm CC'ing Mike on this post as I'm not sure he is a member of this group.

Quoting from Mikes article," A filament transformer center tap is not required, and in fact it's better to use a pair of resistors in the filament circuit to form the center tap for keying. This provides a better and more accurate CT and has the added benefit of providing smoothing impedance for the key, essentially working against the filament bypass capacitors". Thanks Mike that's the first time I've ever seen a reason behind the two methods. I wonder if this was your own investigation work Mike or that you found this in some old technical reference source?

I do remember seeing a center-tapped filament transformer used in a design in one of my old Stancor transmitter manuals/catalogs, but other than that everyone seemed to use the resistors. I personally use the transformer CT in my designs. I guess I have to question why the relatively small turn count filament CT would not be as good or balanced as a pair of resistors which will also have some mismatch in resistance value. On the impedance end yes I would assume the resistors would have a higher resistance value in the overall impedance, but wonder how the inductive impedance's would compare.

I've always wondered if someone has performed a test on one transmitter of switching between the CT filament transformer and the resistors to see if there was a noticeable difference in the keyed RF envelope coming from the transmitter.

Your thoughts would be much appreciated and your hard experimental experiences most treasured. The engineer in me always seeks that side of the designs as I know often things just get carried along because doing what was done before is the easiest thing to do. If it works don't futz with it! HI

Well, that may be part of the answer, but, I am not sure that it is the whole answer. Remember, most tubes used in transmitters back then had directly heated cathodes (the filament was the cathode) and a lot of AC hum could make the oscillator sound lousy. Also, not everyone had all that much money, so CT type filament transformers were not as available. The resistor method, I believe, also allowed for balancing out the hum. Admittedly, this is speculation on my part, and I have not made any empirical measurements or tests to verify one way or another, nor do I have any theoretical backing for my statements. I'll have to look at Mike's article when I get back home to NJ. 73 - Mike

Subject: [AWA Group] Center-Tapped Filament Xfmr or Taped Resistance

I asked this question several years back and never got a real "technical" answer. I've always wondered why most of the twenties designed self-oscillator transmitter used the tapped resistance across the filament transformer for the DC return vs simply using a center tapped filament transformer. I could never find anything in the old articles or books that explained why either was chosen. That was until the latest article in the AWA Journal by Mike WU2D when he explained the construction of his latest TPTG transmitter. I'm CC'ing Mike on this post as I'm not sure he is a member of this group.

Quoting from Mikes article," A filament transformer center tap is not required, and in fact it's better to use a pair of resistors in the filament circuit to form the center tap for keying. This provides a better and more accurate CT and has the added benefit of providing smoothing impedance for the key, essentially working against the filament bypass capacitors". Thanks Mike that's the first time I've ever seen a reason behind the two methods. I wonder if this was your own investigation work Mike or that you found this in some old technical reference source?

I do remember seeing a center-tapped filament transformer used in a design in one of my old Stancor transmitter manuals/catalogs, but other than that everyone seemed to use the resistors. I personally use the transformer CT in my designs. I guess I have to question why the relatively small turn count filament CT would not be as good or balanced as a pair of resistors which will also have some mismatch in resistance value. On the impedance end yes I would assume the resistors would have a higher resistance value in the overall impedance, but wonder how the inductive impedance's would compare.

I've always wondered if someone has performed a test on one transmitter of switching between the CT filament transformer and the resistors to see if there was a noticeable difference in the keyed RF envelope coming from the transmitter.

Your thoughts would be much appreciated and your hard experimental experiences most treasured. The engineer in me always seeks that side of the designs as I know often things just get carried along because doing what was done before is the easiest thing to do. If it works don't futz with it! HI

Mike WU2D sent me the following reply. The Grammer Hartley he mentions in the email I have added to our photos area for now as a reference.

*Hi Don,

Nice to hear from you! Nope, I agree with you, all of the handbooks seem to gravitate towards the two resistor CT approach in the 1930's but like many circuits, nobody explains when or why this change occured! I only learned this by playing with the circuits.

Here is the circuit published in the classic George Grammer article "Rotten signals...". from April 1933 QST. There is no resistors or mention of key clicks, by the way.

This seems to be the classic Hartley and as you can see the key is inserted between The CT and B-. I see no problem with this other than the key click that would occur because of the lack of series filtering impedance. So adding the two resistors certainly would (and do in the oscilloscope) slow down the rising edge of the CW envelope. Perhaps a poorly regulated supply would help. Adding a cap across the key helps on the discharge.

As for the accuracy of the center tap of transformers, I know that on regenerative receivers and on HiFi amplifiers and even Guitar amps, the CT resistor method is always preferred to get the best hum balance. CT transformers aren't - I mean they are not as balanced as you would think. They wind them closely but they are not perfect.

Mike WU2D *

Thanks to the two Mikes for the comments on the center-tapped transformer vs resistors methods. (FYI, Mike WU2D I fowarded your reply to me to the AWAGroup)

I'm wondering just how much the "hum" would be an issue in these power oscillators. I'm aware of the tube stereo hum adjustments. However, in most of those the filament wires not only supply the final output tubes, but could be supplying all the preamplification, buffer, phase inverter tubes as well. So in those cases the filament lines could become quite unbalanced along the way. I have both a Dynaco ST-70 and a Stromberg-Carlson P-P amplifier that use the hum balance pots across the filament lines. Indeed they both provide an audible reduction or elimination in the AC hum in the final audio output. Then again, none of these stereo systems have a grounded CT on their filament transformers either. Still what type of modulation would or could that cause to one of our oscillators (transmitters)?

My experience listening to the 29 QSO Party stations is that I don't hear a great deal of Key Click problems, perhaps simply because they are masked by wabbling, chirp and all the other fine characteristics of these oscillators. So for me the rise and fall time of the RF is not as big a concern as the ability of the oscillator to start and stop fast enough and be stable in frequency once it does start oscillating.

Most of you guys have much better sounding transmitter than my sad Hartley. Since I don't use the resistors may I suggest a little test. If one of you could power up you 29 transmitter into a dummy load and listen in on a receiver (much attentuated front end). Do an experiement by seeing how the output signal differs between your normal tapped filament resistor and then lift one side of those resistor(s) out of the circuit. Thus, your DC return path would be through only one leg of the filament supply. What happens? Does it still oscillate and what noticeable change to you hear? This would place us at the extreme of unbalance on the DC return path.

Anyone up to the test?

Eddy -

Well, I just had to try it myself. I never added a photo before to an group, but, after seeing you post, decided it was a good time to try. I uploaded a photo of the transmitter/receiver that I talked about in a previous post. I had to take the photo from a web page as I am still in San Diego. Comments welcome. BTW, uploading the photo was no problem. In case some of you did not see the web page previously, that shows about 10% of my accumulation of "good stuff", check it out;

Hi Mike,

Nice picture and I'm sure that is one-of-a-kind! I looked through a bunch of my books and other documents and it almost looks like something that Leeds out of NYC would have produced. They did sell in-house constructed receivers and transmitters and used a framing similar to your pictures on some of their transmitters. The store is still in Brooklyn, but I doubt they have any knowledge of all the items they constructed in the 1920's. Since they were primarily a parts distributor their equipment was a combination of many source manufacturers.

In my Tube Type Transmitter Guide by Eugene Rippen they show a later Leeds Special 75 watt Master transmitter that appears to use the same label plates as those on your transmitter tuning controls. Most of the examples did not have a Leeds ID plate on them either.

Super Nice es 73

Don -

The markings on the front panel are engraved, they are not plates. Even the transmitter calibration scales on the top section of the panel are engraved. It is a dilemma for sure. I'll take photos when I get home. 73 - Mike

Ok on the engraving. I'm not sure about the panels on the Leeds transmitters. The pictures in the Rippen book are rather poor photo-copy quality. I looked through the 1923-1926 years of QST and Leeds never advertised. Considering your tube line up in the receiver I'd expect that to be a 1924 -1926 unit. I'm sure the transmitter tubes could have been many variants and since you have blue Arcturus tubes in there now, I'm pretty sure that wasn't original. Since Leeds started in business in 1923 it sure would be nice to find some of their early advertisements or catalogs.

I'll scan the picture of the Leeds transmitter. I just assumed they were engraved plates, but maybe not. They do look very much like yours in the picture.

Hey BTW if you ran this whole setup in the 29 QSO Party you'd be the first to use a transceiver in the event, hi.

Hi Guys,

The cyber gods were good to me this morning...I finally managed to upload the QSL card image that eluded me before.

The image could well challenge the level of personal political correctness within the viewer. It is not my intent to glorify its symbolisim in any way, but rather, to show how far things can go when taken to the extreme, & how one's vantage point on the "...history curve" can skew one's opinion of certain things...

One thing's for certain: even I was taken aback when I first saw this card...with due consideration given to the context of time, however, it all seems so innocent & simple.

Eddie -

Which part do you mean? I do not see anything wrong with it at all. If you mean the 1KV, well, that is not unusual. One can often find 201s and 210s with holes burned into the sides. Also, the duty cycle was low. Regardless, the plate was glowing cherry red every time the rig was keyed, HI. I am sure the tube did not last long. 73 - Mike

Hi Guys,

I'm getting REALLY quite handy at this uploading stuff anymore here...! Hi Hi.

I've just added some more 1920's-era "Canucklehead" (that's CANADIAN, you ^&%$#
foreigners!) QSL cards on the website. Some of these go all the way back to 1923, a mere 2 years (or thereabouts) after the practice of QSLing even dawned within the Ham fraternity.

Lotsa Hartleys & 210s "...back in the day", as may be seen a few of the cards.

Enjoy!

~73~ de Eddy nc3CUI - nc3XZ

Great cards Eddy. I'd love to have the 3NI transmitter! Four UV202, WOW. Two nice UV202 just recently sold on eBay for near $500 USD. Beside their power they are just simply pretty tubes.

I just won an eBay auction earlier this week that has a 1BCG QSL in it. It's from 1923 so it was two years after the big Armstrong and Godley (+ others) event. It is the same station and owner though. For those who don't recall the 1BCG station just Google the callsign. I'll scan and post with my others once it arrives. I'm still trying to locate my 9SO QSL that was from my Alma-mater "The Milwaukee School of Engineering", albeit the card proceeds my attendance by 50 years.

Topic: 65 Message: 65

I'm starting to think about next year's LC. I'd like to pull my Meissner Signal Shifter (http://www.prismnet.com/~nielw/shack_tours/wa5vlz_jan88.htm) out of retirement and use it to drive an amplifier. I have a couple of TZ-20s that look like a good match for push pull up to about 100 watts but I'm short a 7.5V filament transformer.

Any thoughts on using 7.5V triodes with 6.3V on the filaments? Is there a problem with not running the directly heated cathodes at full temperature?

73,
Niel - W0VLZ

Hi Niel,

I seem to recall reading somewhere (an old issue of The OTB maybe...?) that running tubes at reduced filament voltage can be just as detrimental to tube life as running them over the ratings...

But as Lou says, 7.5 VAC iron is hardly the stuff of "...unobtanium"---yet---so sniff around...you're bound to find something.

Good Morning All,

I've posted the last (honest!) of my vintage Canadian QSL cards onto the site now---these cover from 1929 to (I think) 1938, and all incorporate the now-universal "VE" prefix that was adopted in '29...

In fact, I believe Canada adopted the "new" internationally-mandated prefixes even before the USA did (but only by a matter of a few months, or so).

The site is starting to look a lot like a QSL printer's catalogue from ye olden daze...! I actually like more than a few of the designs shown therein, & may well incorporate one in my next batch of QSL cards (due in a month, or so), similar to what Steve has done with his...

I haven't had a chance to check out the OT QSL cards on the AWAGROUP yahoo site yet but I will. I have a fairly large collection of 20's cards as well, and I enjoy going through them and learning about the equipment and conditions at the time. I am also amazed at some of the high voltages applied to the 210 tubes.. I also chuckle at some of the transmitter photos where high voltage is connected to the transmitter using Fahnstock clips.. Zzzzrtttttt.

I have a few OT qsl cards up on my webpage here:
http://home.comcast.net/~wa9wfa/vintage_qsl_cards.htm

The 9SO link isn't working but the picture is located here:
http://home.comcast.net/~wa9wfa/9SO.jpg

This card was sent within months of Don N9OO's card. I met WPG back around 1976. You can see the equipment used in that QSO on my W9HHX webpage here

http://home.comcast.net/~wa9wfa/ha00032.htm

WPG wasn't at school the day the photo was taken. Too bad because it would have been fun to see Bill right around that time.

Hi Scott,

Do you know what's really amazing...? Hams back-in-the-day were NOT dropping like proverbial flies due to accidental B+ contact, the way we to-day may have expected they did...

In fact, reading through my issues of QST from the 20's, accidental deaths were probably no more frequent then, than they are now---indeed, one seems to hear of a new fatality about every third month, or so, now...generally because of tower / antenna mis-haps.

I guess in ye olden daze the OTs had no choice BUT to be vigilant & careful with what they were doing! And with certain exceptions (Ross Hull's untimely demise comes to mind), that was, indeed, the order of the day.

Hi Niel,

First a 6.3VAC filament transformer is only 6.3VAC at its rated current. I run my 210 Hartley using a 6.3VAC 3A transformer. At the lower current draw of the 210 tube I'm seeing 7.2VAC at the filament pins.

I'm worried about those who buy the 7.5VAC 10A transformers to run one tube transmitters and then discover they are at 9VAC on the filament pins. I'd rather run the filaments a little low than a little high.

Once you have the current requirements for those TZ-20's then see if you can find a 7.5VAC transformer with the same current rating, or not a 6.3VAC with a rating a few amps more.

This is an invitation for everyone to join in on the Phone section of the Classic Exchange this coming Sunday, 2/14. You cn find details at the Classic Exchange web page at http://qsl.asti.com/CX/<http://qsl.asti.com/CX/> . Click on "January/February 2010 CX Announcement." There will be activity on both AM and SSB. Guys will be on using mostly "classic" equipment, so it's a great time for you to try out your tube-type AM and SSB boatanchors. The CW section of the CX ran on Sunday, January 31, and I filled five pages of my log with QSO's on 80, 40 and 20 meters. If the activity on the phone CX is anywhere near the same, there will be lots of stations to talk to and you can have a lot of fun without having to dig for contacts.

Hope to see you there,

Jim Hanlon, W8KGI

Howdy all hands,
     At the risk of making things complicated or to restate the obvious, I offer the following idea:

I have run across the exact same problem in my vintage TX. I use two different filament voltages to boot; 6.3 (89 and 802) and 10 volts (830B). The RCA Air-Cooled Transmitting Tube manual (1938) staets that for Thoriated-Tungsten filaments should have plus/minus 5 percent of rated voltage and the same goes for Oxide-coated filaments. At a short glance I found no state for directly-heated filaments.

If your a stickler for precision, make sure you know the accuracy of your AC voltmeter also some measure RMS and others True RMS. I'm not sure I know the difference. I checked my two voltmeters against a lab calibrated Fluke digital multi-meter.

The upshot of all of this is, I built a small filament voltage control unit using two 4 Ampere Variacs and I dedicated two voltmeters to keep an eye on the 6.3 and 10 volts. This may be a bit extreme but it works.

Thank you for letting me put my 2 cents worth in.

I was pondering the 1KV reported plate voltages. It seems those are Raw AC transmitters (RAC). So wouldn't the tube only be working on half the cycle? Thus they would see a 500VAC half wave which would be even less DC after self-rectification? I think that would explain why these transmitters didn't send the vacuum tubes into orbit. Or am I wrong? Can't say I have any experience with running a transmitter RAC. I know Bob W2ZM has done this in the past. I'll have to go back and see if an old OTB has any article on RAC transmitters to understand the principle better.

Don't forget the AWA AM QSO Party is coming up. A good opportunity to get those vintage (or modern) AM stations on the air. This year W1HRX (The James Millen Society) station will be run by Dennis K0EOO out of Lakeville, MN. Dennis has a beautifully constructed 500 watt Millen setup which can be seen here <http://www.isquare.com/millen/members/k0eoo.htm>. W2AN will again be operated from the AWA Annex in upstate New York and they will be using several stations, including the original James Millen transmitter/receiver <http://www.isquare.com/millen/bio_rem/mmstn.html> from the 1930's. Note, you don't have to be an AWA member for this event. This QSO Party has always been open to all amateurs!

EVENT: 2010 AWA Amplitude Modulation QSO Party
DATES: Sat. Feb. 20 @ 2300 GMT to Sun. Feb. 21 @ 2300 GMT
Bands: 80, 40 and 20 Meters
Special Conditions: AM is required. All ages of equipment and all power levels. Extra credit for working one or more Flagship Stations, typically W2AN (James Millen's personal xmtr.) and W1HRX (Millen's personal call).

This Event's printable Log Sheet available here <http://www.antiquewireless.org/hamevents2010.htm>. Logs are due four weeks after contest.

Note if the links don't work or appear above you can visit The James Millen Society website to see the W1HRX and W2AN stations: http://www.isquare.com/millen/millen-page.htm

and the AWA Events site for rules, logs, etc: http://www.antiquewireless.org/hamevents2010.htm

"...Can't say I have any experience with running a transmitter RAC. I know Bob W2ZM has done this in the past..."

Hi Don,

Bob would doubtlessly dispute that statement on principle, I'm sure(!)...

In truth, the circuit he was using was one that was somehow "...self-rectifying"---not sure of the ways & means involved in that particular scheme, but there's certainly no taking away from the fact that when W2ZM fired-up that rig of his on 80-meters, the whole CW sub-band couldn't help but take notice!

To this day I'm convinced that was the secret to his success in the 1929 QSO Parties of yore: nobody could get within 25-KHz of his signal when he was on the air! Hi Hi.

1930's National Radio Receiver the cabinet is similar to a SW4 the tube layout closer to a SW5 bit I don't think it is either.Maybe a kit?

Item number: 160403411405

What is it??

Lou,

I have one similar to this. Mine has the Lafayette Worldwide Receiver plate on the front. Same SW-4 style cabinet, but mine has cylindrical cans for the stage transformers at the rear of the radio. Also, mine is the #27 output tubes vs the #45's, which is a standard variation in the progression of the SW-5 line too. Yet more pictures I need to add to our photo albums.

BTW, mine was completely restored before I bought it at the AWA conference flea market back in the early 2000's. I lost my note on who I bought it from unfortunately, but I also remember buying four new Sventlana 811-10 (audio version of 811 without the plate cap) tubes from the same guy.

I also had a very similar or identical unit. I am saying had, because I do not know if I still have it or not. My most unusual National, all original, is an FB-7 with a built in power supply. From the front it is the same as any other, however, the cabinet is deeper to accommodate the supply. It is all built on the same chassis. No one has seen another. It still has the crayoned initials in the lid. I'll have to take pictures of it as well when I get home. That will be on Saturday, finally. San Diego is nice, but, there is nothing like home. Besides, that is where all of my toys are. Tomorrow I am visiting my old time friend August Link. He is not a ham, but, almost all AWA members know him, or of him. I have been fortunate enough to visit him often enough, even over 30 years ago, before he sold most of his stuff. 73 - Mike

Just a heads up fellows. Due to personal and business time constraints, I am going to step back now that we have the board set up and running. I've added three other fellows as moderators, you can be sure that you are in good hands!

This will allow you fellows to run the board and customize it to member needs. I will still be here to help and assist, but will be assuming a more passive role.

I thank those early folks who got things kicked off - Lou, Eddy, Mike and the rest.
We're off to a great start, and I see big things ahead for the group!

Tnx,
Bruce W1UJR

95. 7.5 volt filament transformers

Yahoo group: AWAGroup (2010 — 2011)
Date: 2010-02-12 19:30:32 UTC
From: JAMES HANLON
Topic: 95 Message: 95

Check out Playthings of Past at
http://www.oldradioparts.com/pg2.htm<http://www.oldradioparts.com/pg2.htm> . In his filament transformer list he has several 7.5 volt transformers for very reasonable prices. I recently acquired two, 7.5 volt center tapped transformers from him that I use in my MOPA rig built with a pair of 10Y's. This allows me to center-tap (cathode) key both the oscillator and the amplifier separately. I do run the transformer primaries through a small, variable resistor to adjust the filament voltage to 7.5 at the tube socket.

I think early transistors are neat. I still have several thousand early germanium and point contact devices. I did have a display of very early transistors from 1949 to the mid 50□s. Unfortunately I sold the display of 50 transistors when I was selling a lot of my better stuff to pay my ex-wife her share of the divorce settlement. Since I have so much shit (whoops, that was supposed to be □good stuff□), there was no way I could sell the house and move, so, I had to buy her share of that too. Regardless, I still like the early solid state stuff, especially if it has the blue Raytheon CK-722s or similar devices in them. BTW, that display did win a ribbon at Canandaigua the year Dr. Bardeen was there and the emphasis was on transistors. Mid to late 80□s sometime I believe. 73 □ Mike

BTW ☐ some early WE transistors sold on ebay a few days ago for about $20 to $25 bucks for a few. These were not real early, so, I was surprised they brought that much. Typically the cylindrical WE point contact transistors go for about $100 each, and fortunately I still have about 50 of those, HI. Finally going home tomorrow. While it is nice and sunny here in San Diego, living out of a hotel room for almost two weeks does suck. So, even though I am going home to about 3 feet of snow, it will be HOME. 73 ☐ Mike

Thanks Lou, Nice guy :) That sure was an enjoyable convention, my first. I got to meet and talk quite a bit with several of the 1929 QSO Party guys, plus the AWA museum was incredible. Even more incredible was the fresh peach pie at that restaurant across the street from the old museum.

Can't remember everyone that I meet and chatted with but I do recall you of course, I roomed with my buddy Don N9OO, met NE1S, W2ZM, W1UJR, W1GIG, Marc Ellis but can't recall his callsign off hand, Ed Gable, and others that don't come to mind at this moment.

One night Don N9OO, Lou, and I sat outside the RIT puffing some fine cigars and sipping wine while talking 1920's radio. It was a good time with good friends.

I would sure like to attend this year. I had wanted to attend last year but got derailed due to family commitments. I'm going to try again this year. Wonder if VE3CUI will be there.

I found a couple of paragraphs in the first ARRL Handbook (The reproduction not the original) where they talked about the self-rectifying oscillator, but no real theory, just that it naturally has a very lousy buzz. Remember back then most were probably run off a generators and might have been anything up to 500Hz AC as well. Lou was right only thing between the HV secondary and the tube are RF chokes in the plate and cathode (filament) connections.

I guess I should drop an email off to Bob W2ZM and see what insight he can provide.

You all should have gotten the notice of my file upload to the group. Appears I got the privilege of being the first to upload a file. This is the only article I could find on the Lafayette WideWorld Receiver or an early variation of the National SW-5. It appeared in the Oct-Nov 1930 issues of Short Wave Craft magazine. Lou, to answer your question these I'm sure were built at the National Factory. Note the article give credit to Robert Kruse for the design. The schematic is pure SW5 early version with the P-P 27's in the audio. The big difference is the audio transformers are in cylindrical cans and only the old S101 is in the standard National square box which we are familiar with from the SW5 and SW3.

I have also loaded two pictures of my Lafayette which were taken in my Red Roof hotel room the day I bought the receiver. I couldn't wait to send a picture off to Scott WA9WFA to brag about my find! Naturally I stayed at the cheaper hotel down the street so I could save $40 a day and spend the money on radios and radio parts, hi.

I can't wait for Mike N4FS to get home so he can upload all those wondeful pictures of his rare transmitter/receiver and that FB7 with a built-in power supply. Have a safe flight home Mike.

BTW, if you guys have never seen the old Short Wave Craft magazines, I personally feel they were much better than Radio Craft. They were geared more toward the Ham vs Radio Craft which was more toward the SWL'er. Thus they contain many articles on transmitter construction. The magazine started in 1930 as a bi-monthly, but went monthly after a few issues. It went on until around 1937 when it changed to being called Short Wave and Television. Like Radio Craft this was a Hugo Gernsback publication. I think I have most issues through 1936, but I'm still missing Volume 1 Number 2.

Hopefully as time goes on I'll be able to upload additional articles when the subjects come up in this group.

73

Don N9OO

Oh yeah - P.S. - Lou on the eBay auction notes. I want to build a sub-folder to my main AWA Group email folder that will filter those posting directly to it. Can you use a creative subject header, beside just the word eBay that will allow me to do that. I'm sure the word eBay will appear in our groups subject fields from time-to-time, so something like "EBAY AUCTION ALERT" or "EBAY ALERT" or whatever that is consistent for me to filter on. I have a quick search area at the top of my Firefox browser that simply lets me paste the auction number and

immediately take me there. I've got the same for QRZ, Wiki, etc etc via simple pull-down. That way I can easily find and review your finds every couple of days.

116. SW-5 and Lafayette Difference

From: Don Buska - The Radio Lab Works
Topic: 114 Message: 116

I know I investigated this in the past, but an FYI. The SW-5 was introduced in the June 1930 issue of Radio News (per John Nagle's excellent Nov-78 CQ magazine article on the SW-5) in an article by James Millen and Robert Kruse. So that was only four months before this Short Wave Craft article on the Lafayette version. The Wholesale Radio version had the square box audio transformers like all the National branded SW5's.The schematic from that original SW5 article is exactly the same as for my Lafayette. The next variation changed out the RF and Detector tube to 35's from the original 24's and then the final version swapped out the P-P 27's audio amp tubes with 45's. There was also a battery version tube line up (32, 30 and 31's).

Their was a great article on the SCARS website on the Evolution of the National SW-Series Receivers, but I just checked and the link is now broken. I hope they fix it as it is an excellent and well researched article. Maybe they don't know the link isn't working from their old Gazette article list.

Well Don, I am leaving for the airport in about 7 hours. Once home and comfy again, I will start thinking about taking pictures. Then, the big problem will be to find a place clear enough in my 5000+ sq feet home where I will be able to take pictures, HI. My place is like a fraternity house, and it is obvious that it has not seen a woman's touch in close to 7 years. But, in spite of all of that, I will make it happen.

My first time at AWA, in the mid 70's, I shared a room with W0EOM (Will Jensby). We had to find a room way away from the conference as all the rooms there were taken.

"...I would sure like to attend this year. I had wanted to attend last year but got derailed due to family commitments. I'm going to try again this year. Wonder if VE3CUI will be there..."

****

Hi Scott,

I last attended the convention in (I believe) 2005---it was great!

Since that time, though, every good intention of going again has been thwarted by other issues---generally "kid"-related, i.e. moving either my son or daughter to a new place at school, moving one (or the other) to school, etc. etc.

Fortunately for me, 2010 shall see my son (finally!) graduated & working full-time, & my daughter graduated. Hopefully this means I'll be free to go to Rochester this summer (I especially liked the bookfair & the forums).

"...I think early transistors are neat. I still have several thousand early germanium and point contact devices. I did have a display of very early transistors from 1949 to the mid 50's. Unfortunately I sold the display of 50 transistors when I was selling a lot of my better stuff to pay my ex-wife her share of the divorce settlement ... regardless, I still like the early solid state stuff, especially if it has the blue Raytheon CK-722s or similar devices in them.

****

Hi Mike,

Some of that early solidstate stuff is far more "...unobtanium" than many vacuum tubes these days...

Case in point: a coupla years ago I bought an old ex-mobile-CB-"outlaw" tube-type RF power amplifier on eBay, for use at 10-meters (a pair of 6LQ6s, driven by a 12BJ6). After a short while, one of the two old QRO germanium-type power transistors in the multi-vibrator power supply went south on me...

These are the old-fashioned stud-mount types.

Anyway, new replacement units from NTE cost in excess of some $75.00 each!!! The entire unit itself didn't set me back more than $40.00...

I ended-up finding a batch of VERY cheap replacements on eBay, from a seller in (of all places) Germany...

Tks, Don.

First of all, I'm sitting here enjoying all the mail while eating Kettle-Fried Jalapeno Potato Chips and a pint of Wellington County Dark Ale chilled to an ale-perfect 45F. Ruff....

I have one similar to this. Mine has the Lafayette Worldwide Receiver plate on the front. Same SW-4 style cabinet, but mine has cylindrical cans for the stage transformers at the rear of the radio. Also, mine is the #27 output tubes vs the #45's, which is a standard variation in the progression of the SW-5 line too. Yet more pictures I need to add to our photo albums.

Do you and you, Mike agree that the rx shown on eBay was built by National? The wiring and all... If so, was it a one-of made to order? What?

Mike- My most unusual National, all original, is an FB-7 with a built in power supply. Market, Mike?

BTW, mine was completely restored before I bought it... Such luck... :0(

Hello,

I thought it time to introduce myself. I am a new member of the AWA group. My name is Roger W. Kuchera. I am a ham operator and the call is K1TG. I am retired from the computer industry. My electronics training is from the U.S.Navy in the late 50's. I do a considerable amount of homebrewing and restoring basket cases for use in my vintage 1930's station. At the present time I have 3 stage, homebrew TX using a 89/802/830B lineup. The main RX is an FBXA/PSK combo which I restored. I look forward to being a useful member of the group.

CUL, Roger/K1TG

My name is Roger W. Kuchera. I am a ham operator and the call is K1TG. I am
retired from the computer industry. My electronics training is from the
U.S.Navy in the late 50's. I do a considerable amount of homebrewing and
restoring basket cases for use in my vintage 1930's station. At the present
time I have 3 stage, homebrew TX using a 89/802/830B lineup. The main RX is
an FBXA/PSK combo which I restored. I look forward to being a useful member
of the group.

Tks, Larry.

I have admired his rig for the workmanship and, the secret is now out, QRO.

Is Mark aware of the AWA on-air events?

73, Lou VE3AWA

Has anyone worked AB0CWs rig and how did it sound? Lou

I've worked Mark before, but I don't think it was that particular transmitter. He's built several.

I am very delighted to see you here Roger! You've come to a great group.

I don't think we've had the pleasure to meet, but I've seen your handiwork and homebrew efforts its some of the best! As a National FB-7 owner myself, I seem to recall that you might be the one who had a SW-3 has a preselector?

I look forward seeing more of your projects, and if I ever get around to it, working you on the air. Wonder if you attend any of the New England radio meets?

Flash....

"I have never been more proud to see an overdue acknowledgment given to anyone as I am to see Mr. Harry Krout, WØYQG, be featured in the news. Harry is a tireless worker for any goal he intends to achieve.

When Harry took away the dirty old W9UA rig in the bed of his truck and lived close to it for over a year, I suspected it was a labor of love. Now when we see it in it's rightful place next to the W9BSP KW rig in the 1925 radio room at the Ensor Museum, it is though an oversight has been rectified. And, it operates as it used to 76 years ago.

This coming Saturday evening, we will offer the 'dit-dah-dit' tone of the CW mode to the ears of hams across our country and look for their QSL cards to pour in soon after. Thanks to you, Harry. JOB WELL DONE!

Work the W9BSP call at 1.895 KC [mHz for modern hams], 7PM to 11PM Sat, Feb. 20th."

Larry Woodworth WØHXS
Ensor Mgr.

When I've worked him in the past it has been in AWA on-the-air events. But that was several years ago when he was still living in Ohio. I haven't heard him since he's moved to Colorado; don't know if it's because he hasn't been active in them, or if it's just the greater distance. A review of recent contest reports in the AWA Journal would tell us if he's been participating recently.

147. Interesting Set - Can You Help ID?

Yahoo group: AWAGroup (2010 — 2011)
Date: 2010-02-19 13:51:21 UTC
From: Bruce W1UJR
Topic: 147 Message: 147

Hello all,

I picked up this set at the radio meet last Sunday in Boston...along with a wicked sinus cold.

Photos are up at http://gallery.me.com/brucehowes#100497

Clearly its some sort of regen receiver, but that's about all I know.
I did see this very same set at last years radio meet, its been
kicking around for a while.

The front panel is metal, appears to be aluminum, and the
chassis is a stained and varnished wooden breadboard.

Front of the front panel is labeled as "Doerle TWO~ER".
Below this, about 2/3 of the way down the panel, is a label which read "CHI-RAD".

It also has a sticker on the rear of the front panel listing:
Chicago Radio Corporation
415 S. Dearborn St., Dept. S-43
Chicago, III.

There is another label near of the bottom on the back of the front panel,
but can not be read, appears to have been partially removed, or perhaps
the adhesive has come loose.

The set uses, or currently has installed, a pair of Westinghouse 230 tubes,
one of which has a test label dated 1931.

The wooden breadboard is interesting, has labels on the wood, appear
to be painted or decal, listing connection points.

The feedthrough bushings, where the wire go from the top of the chassis to the bottom
are hollow metal material, flared on the ends for retention.

Tube sockets are marked "Pacent" and seem to have some sort of
adjustment mechanism?

The bus wire is square in cross section.

I am thinking that this was some sort of kit offered by Chicago Radio, but
don't know the vintage. Of course, it might be a very well built repro unit.

Cordially,
Bruce W1UJR

I was recently reminded of a radio I saw as a youngster in the early 40's. It looked a bit like an AK 10 in a console cabinet. A most notable feature was a single knob tuning system employing linear variable condensers connected by mechanical links. By linear I mean the condenser plates slid straight together or apart to vary capacitance - plate motion definitely was not rotary. Tubes looked like 201 type's - I don't remember the count. I suspect the radio was from the 20's era. Does anyone have any idea what brand this radio may have been? History?

Since I answered this same post on the othere AWA list I won't go into it all again.
I will add that your statment below is incorrect.

"It also has a sticker on the rear of the front panel listing:
Chicago Radio Corporation
415 S. Dearborn St., Dept. S-43
Chicago, III."

It says "Chicago Radio Appartus". Not trying to be picky but that says a lot to
me given the other things I observed about the set. I still think it's an original
set from the '30s. I agree with you that it's more then likley a kit.
I really like it.

Good catch John, blame it on my head cold/sinus thing for not translating that correctly!

I just Googled the address, no radio store left there now, appears to be a large commercial building or parking lot.

Rodger WQ9E just sent me a neat article from Bill Orr on the Doerle sets, looks like its from
the April 1978 CQ issue.

Do you mind if I cross post your comments to this reflector, others might benefit?

Have not fired up the set yet, haven't felt well enough to even check tube filament continuity, hopefully this weekend things will turn around.

Cordially,
Bruce J. Howes

Hello all,

I would like to notify/remind everyone that this weekend, 2/20 - 2/21, will be the 2010 AM QSO Party "sponsored" by the Antique Wireless Association.

It will run from 6PM EST Sat. through 6PM EST Sunday (2300Z Sat. thru 2300Z Sun) on 75, 40, and 20M.

More details, and a link to the logsheet, are here:

http://www.antiquewireless.org/pdf/amqso2010.pdf

and here:

http://www.antiquewireless.org/hamevents2010.htm

Note logging requirements are minimal!

Hope to hear a lot of participation, and to talk to some of you on AM.

73,
-Larry/NE1S

Lou -

I will have to check on that later. However, the XX suffix makes it curious. Where did you find the call? BTW, I did manage to make a path to my old museum room and found my spark oscillation transformer like you were asking about. Mine definitely has the F. B. Chambers logo on top. Check yours again, but, I will take a photo for you. 73 - Mike

Thank you, Mike.

The XX suffix only used to help clarify my question. No particular stn in mind.

I have examined every surface of my osc. xfr in good night and there is no reference to the manufacturer. It has not been re-finished. Yesterday I took several photos to send today in the hope that you can verify that it is or is not a Chambers.

Yes, pse send a photo of your treasure.... Is ur coil sitting on a condenser box or is that a spark coil?

73, Lou VE3AWA

Well, in that case I would guess Spain, but, like I said I have yet to check, so, only a guess. I uploaded another photo to my folder (N4FS) showing the coil sitting on top of a glass plate condenser. I rebuilt that condenser, and, it took me at least 20 tries before I got it right. The pressure on those glass plates is simply amazing. In my case it was driven by a Marconi HV transformer and a Chambers rotary gap. I either always had arc-over, or, plates were cracking. With all of the tools and technology available to me today, I wonder how they ever got it right to begin with. Some early text by Steinmetz helped. 73 ☐ Mike

Lou,

In 1927 ec (notice lower case "ec") went to Czech hams. Like nu for the US hams. Formal divvying up the alphabet didn't come for a year of two later.

btw, for a report of Czech licensing procedure/cost see pg 56 of Oct '27 QST. Search the QST on-line archive for "Czechoslovakia"...300 crowns to take the test and if you fail twice you were banned for life from getting a ham license.

Mike I find your pictures of the "old museum room" fascinating. You have a mini-AWA annex right in your own home. Gosh even the vintage lawyer book shelves to boot! Have you ever cataloged your entire collection? I would assume for insurance purposes you'd almost have to. Although I keep telling myself I need to do the same I keep forgetting to spend the time to do it.

Bruce,

That Gross Eagle Receiver is absolutely beautiful! If you didn't perform a full refurbishmenton it then life has been good to that thing. How does it work? Is it something you can use to receive with in the 29 QSO Party? I'm sure that it is one of a kind. I'd be willing to give you four times it's original selling price if you ever want to sell it, hi hi.

Thanks Don. I have often attempted to catalog, but, it is an impossible task. Almost two years ago my basement flooded due to a water heater rupture. That was an insurance nightmare. My list to the insurance company consisted of almost 700 line items and over 20,000 items. It added up to over $200K. The insurance company paid 100%.

In case some of you have still not seen part of the collection, here is a URL of less than 10% of it. Enjoy ☐ 73 ☐ Mike

Mike I find your pictures of the "old museum room" fascinating. You have a mini-AWA annex right in your own home. Gosh even the vintage lawyer book shelves to boot! Have you ever cataloged your entire collection? I would assume for insurance purposes you'd almost have to. Although I keep telling myself I need to do the same I keep forgetting to spend the time to do it.

Hi Ron & group,

I spent my time last night on 75M, working several stations over the period of about 3 hours. My 4th contact will certainly be my most memorable - Pat G3IKR and I were able to have a good, solid QSO on 3615 Kc/s. Great to finally hear the voice behind the keyboard. Other notables I talked to include W2AN with Dave KA2J at the mike, listmember and friend Jerry W1ZB, a couple of Florida stations (nearly DX for Maine on 75M), and YL Kerri, KC2UFU, was in the round table with us for a long time, beyond the time I left the frequency to snag W2AN, my last contact before I stoked up the coal stove for the evening and went to bed.

Unfortunately I did not run into W1HRX; perhaps our paths will cross today.

40M should be better today - on the east coast 10:00AM - 2:00PM seems to be best. I worked a lot of stations on 40M 2 weeks ago in the AM Transmitter Rally.

I also will be on 20M. Pat said to look for him on 14.286, which is always the center for 20M AM activity, around 1200Z.

73,
-Larry/NE1S

Just talked to Pat G3IKR again on 20M (14.286). He's there right now if any of you want to try to work him.

Conditions were rough here. My tribander is frozen pointing towards the southwest, so northern Europe is kind of off the side. Also, I had to use the Breting 9 (which is broad as a barn door), becasue my R390/URR developed a problem last weekend, so it's on the bench receiving TLC instead of stations. But we made it!

Great talking to you again, Pat!

Good Morning All,

Well, I think I "blew" the balance of all of my free time already here this morning---but it was time well spent!

I made a grand total of 10 QSOs on 40-meters AM...

Conditions were VERY good indeed---and one of the highlites was a brief discussion re. the AM QSO between Larry (NE1S) & that "G" station fom 'over 'ome, on 80-meters. Congratulations, Larry--well done, indeed!

Surprising how so very good-sounding on AM all of the "...rice rockets" were, too (NOTE TO LOU: take heed!).

Hi fellows,

Bill Orr wrote a number of articles over the years on the "golden years" of radio. Wonder if anyone has complied those into a book, or separate PDF files?

Rodger WQ9E was good enough to send me a copy of Bill's work on the Doerle sets earlier this week, and I've enjoyed reading Bill's writing on Gross Radio. I'm thinking that more of us must have scanned or saved his articles over the years, anyone have anything to contribute?

I agree regarding the price - but I do not consider this "wireless". Just an early unique broadcast receiver. But I do like its simplicity. Just have a few minor doubts about originality from that vintage. This is no more expensive than I used to pay for some British crystal sets from the 20's about 25 years ago. Actually considering the value of the dollar since then, it is probably a lot less, HI. 73 - Mike

Good Day Guys,

How'd everyone fare in the Party this past weekend...?

I was hardly serious, but still had fun making 14 QSOs---all on 40-meters, & all made with my old Drake Twins.

The width & breadth of the gear used was simply amazing---everything from software-defined "radios", to real OT vintage stuff from days of yore.

I was surprised at how many of the guys I worked said that the audio from the T-4X was as good as it was...I KNEW I shudda bought the Twins 25 years ago...! (hindsight is still 20-20 vision, Hi).

I have used CLR in an ultrasonic cleaner for over 30 years with great success. Just keep an eye on it as it does not take long, and overdoing it can have negative effects. What you need to do is take the brass/copper off and clean them by themselves. They should look as new after you are done. Some polishing after will be required. – 73 – Mike

Bill,

I've heard boiling in dilute lemon juice does a great job cleaning air variable caps, but I've never tried it so can't speak from personal experience. It MAY be effective on your tarnished knife switches, but I'd try an expendable one first, if that's possible.

I would add my appelation to the use of the dishwasher for cleaning old parts. Common sense would dictate not to use this method for things like IF transformers, etc. I also recommend a short treatment in the stove at 100 to 125 degrees. It gets any residual moisture out.

CUL, Roger/K1TG

These coils are for the WWII BC-610 transmitter. Notice the bottom right coil has a jack bar attached to it. It's worth almost as much as the coils.

I was just given and old cathedral style tube radio by a friend at church who said it was something hanging around from an uncle, etc. I created a photo album called "AA1WW-Cathedral" with pictures of the set. I has absolutely NO labels, embossing, or any other visible indication of its origin that I've seen thus far.

It seems to have an interesting permanent magnet speaker. There are two controls with wooden knobs (which somebody painted white) and a push-pull on-off switch. One control is the dual-gang large capacity variable cap and the other is a 12K Ohm (might have originally been 10K Ohm) potentiometer. The tube complement is 12Z3, 6D6, 6C6, and 38 and the filaments are wired in series but the series string feed wire is unconnected.

The transformer that was dangling in the back was connected inexplicably to various wires dangling out of the set.

I have attached some hand-drawn notes regarding the under-chassis coil assembly which seems to possibly have comprised a plate-current controlled regenerative stage using the 6C6 (seems wrong to use the sharp-cutoff pentode for regen with the 6D6 remote-cutoff device sitting right there). Since there are no IF transformers present the only other option is a TRF (but the 6C6 plate circuit doesn't play with that) or a direct conversion where the 6C6 was the local oscillator (that seems too far-fetched). I'm still trying to extract portions of the schematic (as wired). I guess the coil assemblies on opposite sides of the chassis could be enough to isolate a 6D6 RF stage from a 6C6 regen stage (though I would have used two 6D6's). The fact that there's only one potentiometer means that if it was a regen, there was no separate explicit volume control.

I haven't worked out the above-chassis coil assembly yet. It has two windings and a flying lead that may have been an antenna connection in the past.

The solder joints look pretty decent including solder joints to the steel chassis. So even though I had an intuition about a kit or instructional element in a radio course, it's probably a retail radio.

Anyway, it sure is fun doing the archeology on this thing!

More to come.... (gotta get back to real work!)

Coop, AA1WW

Hi Coop,

The tube line up would indicate it's probably a TRF set: 6D6 RF amplifier, 6C6 detector, 38 audio output, 12Z3 rectifier. It would be very unusual for a consumer broadcast radio of that vintage to have a regenerative detector. (If it's shortwave, then, yes, it probably would have a regen. det.)

It probably used a resistance line cord (i.e., curtain-burner) to drop the voltage for the heater series string, and that resistance line cord is probably long-gone. The voltage-dropping function could be replaced with a transformer, capacitor, or resistor (or inductor?). Perhaps that was what was being accomplished by the outboard transformer JS.

Since it originally was most likely an AC/DC (transformerless) set, whatever you do to bring it back to operation would best include a transformer, even if it's an external isolation transformer, for safety's sake. You could use a power transformer and change out the rectifer tube to a more common one (such as an '80). if you are willing to perform drastic modifications to the set to get it working (don't know if this set is beyond restoration, or not).

Let us know how you proceed.

The best way in my opinion and one which i use to restiore brass and copper and also polish other metals and indeed plastic, is to obtain a small polishing mop (preferably stitched type
as they are somewhat stiffer) say about 3 inches in diameter, and some polishing compound (comes in various grades). Run the mop in an electric drill or on the other end of a bench grinder. You will be amazed at the results. The mops and compounds I am sure will be obtainable over there but in the UK "The Polishing Company" I have found to have just the thing. I have no connection with them.
I used this method to polish up the copper and plastic on my 1929 Hartley.

Larry,

TRF seems very reasonable but the only way the 6C6 gets plate voltage/current is through the unconnected dangling lead of the loop winding on the under-chassis coil and that coil is part of a tank in the 6C6 grid circuit. Maybe someone made some mods somewhere in the radio's history. Not having a regen control and a volume control is a pretty strong vote against a regen.

I should have taken a picture of the line cord by itself. It has an old two-pronged plug and three conductors to the radio. A number of wires in the radio including the filament series string feed wire so maybe THAT'S where it used to connect (thank you!).

I will definitely put some transformer isolation into this thing. I could do back-to-back 6.3V filament transformers, replace the 12Z3 with a 6Z3 and wire the filaments in parallel. I would also add fusing and an NTC thermistor.

It's looking like I might not be able to discern the original wiring of RF and detector circuits but maybe I can find a similar circuit and kind of emulate/transmogrify it into that.

Thanks for commenting. I will add to this thread when I get a chance to trace a decent representation of the current as-wired schematic.

Ever seen a speaker like that before? Any info?

Thank You,
Coop, AA1WW

Hi Bruce,
I might mention that Brasso or Noxon has a considerable amount of Ammonia in it plus (I think) Pumice: Beware! Ammonia will etch or dissolve copper. If you read the directions in
Tarn-X they say not to leave in contact with a metal object for more than a couple of minutes. I have used Blue Magic Liquid Metal Polish and FZ Metal Polish (it also does well with fiberglass and paint). A slightly more agressive polish is Mother's Mag Polish. They all claim to have no abrasive in them but I am suspect of that. Let's face it taking off tarnish will also remove minute amounts of metal.

A good source for parts IF you have a time machine. John Hern passed away back in 2002.
I contacted his wife when I found out about Johns passing. She said they were
estranged and she had no contact with Johns estate. She didn't know who ended up with his
remaining parts and couldn't or wouldn't give me any information. Such a shame too because
I was in a discussion with John to have him make me an etched front panel for my 1927 MOPA.

I didn't notice the date on the page Scott. What a shame as John sure provided a real service. Yeah you have to wonder what happened to all the material after his passing.

I've been working on a "manual" for my wife in order to cover the same unfortunate situation. Basically it's a manual on how to shutdown things like my website and email accounts if I should suddenly meet my demise. Including all the on-line billing I currently perform. John's website is a very good example of how long a website will go on without anyone doing something to stop or shut it all down.

Thanks again Scott for the heads up. The poster on the Glowbugs site did specifically say this wasn't a legit source any longer.

Lou I think the DX-35 would be a wonderful AM transmitter. My little Millen uses a 6146 final also, modulated by a pair of 6146's and I'm always amazed how good that little bugger does in the AWA AM QSO party. It's all in the antenna's!

If you are going to restore these switches you will inevitably have to remove some metal but it
will only be a small amount unless things are badly pitted. I find fine grade wet and dry emery
paper used wet is a good starter for badly corroded things. I think nearly all metal polishes
have some abrasive in them otherwise they would not work. The corrosion on copper will
contain copper sulphate, possibly copper chloride, and copper oxide. The sulphate and
chloride are soluble in water but the oxide is not hence the need to abrade it off. You could of
course clean it in nitric acid but that would be an extreme step as it will dissolve the copper
very quickly.

Lou,

A DX-35 will make you contacts under favorable conditions, of course, but it's only about 8W-ish carrier output on AM because it's screen-modulated. You would have much better luck running it through a linear amp (don't know if you've got one). I made my 1st AM contact way back when with a DX-40 "barefoot" into a terribly inefficient Marconi antenna w/ woefully inadequate counterpoise.

I think you would have much more fun building and using a pair of 46s modulated by a pair (or something larger). It doesn't have to be a masterpiece at this time - throw it together, and if you like it and feel so-motivated, you can rebuild it and make it pretty later.

Another thing you can do is just throw together a Heising modulator for one of your 1929 rigs, but they can be pretty squirrelly to get adjusted correctly. And of course low power. But W2ZM has a very nice-sounding and effective 160M AM rig with this concept.

221. EF Johnson Cap Specs?

Yahoo group: AWAGroup (2010 — 2011)
Date: 2010-02-24 22:39:02 UTC
From: Niel - W0VLZ
Topic: 221 Message: 221

Anyone have voltage breakdown specs for EF Johnson capacitors? I have a 100ED30 I'd like to use in the plate circuit of a PP TZ20 (or TZ40) amplifier (C4 at http://w0vlz.blogspot.com/) and I don't know how high I can push B+ across the cap. Laying a ruler against my cap I see six stationary plates in 1.25 inches (or about .21 inches/plate). I'd rather not have to isolate it from ground.

Next, given a specific B+ voltage how do I estimate peak RF voltage?

tnx es 73,
Niel - W0VLZ

Niel -

The 100ED'30' tells you that the HV breakdown is 3000VDC. The 100 is
the nominal maximum capacitance, the E describes the construction and
mounting configuration, and the D says it's a dual cap.

Bruce,
I have a CQ mag from Nov 1971 with a "golden year" article by Bill Orr.
The article for building a 1934 style TX with a #47 osc driving two #46's.

I can scan the article and email it to you if you'd like.

I'd like to see his articles on the Doerle sets. Are you going to put on
your web site?

John
KB7NRN

Hi fellows,

Bill Orr wrote a number of articles over the years on the "golden years" of radio.
Wonder if anyone has complied those into a book, or separate PDF files?

Rodger WQ9E was good enough to send me a copy of Bill's work on the
Doerle sets earlier this week, and I've enjoyed reading Bill's writing
on Gross Radio. I'm thinking that more of us must have scanned or saved
his articles over the years, anyone have anything to contribute?

Cordially,
Bruce J. Howes W1UJR

Bruce -

I've suggested several times to CQ that they publish a compendium of Orr's articles. I was told that his family either couldn't, didn't or wouldn't release the copyright.

Since CQ now also owns the rights to Ham Radio Magazine and Ham Radio Horizons, both of which have quite a bit of Bill's work, they could also use those if they could get permission.

If they're that jealous of copyright, it might spell trouble to post articles on websites as well.

Thanks for the info Garey, sounds like an unfortunate thing, but you're right to be concerned about copyright. Given the precedent of the "Fair Use" doctrine,
which allows limited copies for "commentary, criticism, news reporting, research, teaching or scholarship"
it unlikely we'd have much trouble sharing a copy amongst ourselves, but posting such would not be a good idea.

So much info is out there that will soon be lost due to deterioration of paper, limited copies, etc.
I've admired what Google is doing with its "library" project, scanning in old books and magazines,
but its doubtful that the early ham publications have much economic value to justify the cost of
that work to a company like Google.

Again, I think we're safe with discretion and "Fair Use", and it might just be the only way that Bill Orr's
wonderful stories again see the light of day.

Cordially,
Bruce J. Howes W1UJR

I have seen many ARRL handbooks and had several complete sets, and, still have a complete set back to 1926 the 1st edition. I do not recall ever seeing a hardbound ARRL handbook prior to the 70's or 80's when they first started making them. Are you sure it was originally made that way by the ARRL? Regardless, congratulations on a nice find, those early ones are scarce. 73 - Mike

Great find John!

Yes, very cool.
Have two of the same, early handbooks, picked up at a radio meet in MA a few years back.
Seem to have the same content, but a nice burgundy leather or simulated leather cover.

QSTs seem to be found with hardcover as well, appears that some companies did that
for hams, not sure if it was a League thing. Makes for a nice, clean and study archive!

John -

I don't know much about copyright law either, but the way I understand it, copyrights no longer expire after a number of years, or even with the death of the author!

MANY magazines insist on full rights to articles they buy, to allow for reruns, reprints and compendium production. However, many "important" authors grant only one-time rights to a specific publisher. If the publishers want the article bad enough, they agree.

Hi Mike,

They made harcover editions of The ARRL Handbook going all the way back to (almost) the 3rd edition, at least---I know, because I have one here! Hi Hi.

I have seen many ARRL handbooks and had several complete sets, and, still have a complete set back to 1926 the 1st edition. I do not recall ever seeing a hardbound ARRL handbook prior to the 70's or 80's when they first started making them. Are you sure it was originally made that way by the ARRL? Regardless, congratulations on a nice find, those early ones are scarce. 73 - Mike

Subject: [AWA Group] Early ARRL Handbooks hard bound?

I picked up three early ARRL Handbooks from a ham swapmeet this last weekend. The 1935 and 1930 Handbooks were soft bound but the 1928 Handbook is hard bound and in pretty good condition. The '28 HB is the Third Edition Second Printing.

Didn't know they made a hard bound version back then.

Well, I received the subject item yesterday. As I mentioned before I had some doubts about its originality, and, now sadly they are confirmed. The set is indeed a replica, built using old parts, but, probably built in the 70's or 80's. As I always say - tuition never comes cheap - we pay for it one way or another. Still, a neat looking set. 73 - Mike

The article for building a 1934 style TX with a #47 osc driving two #46's."

I don't have that article in front of me right now, but I've read it through fondly several times. As I recall there may be an omission in the schematic diagram. There is no coupling capacitor shown between the plate tank of the oscillator and the grids of the amplifier. Make sure you put one in if you are duplicating the rig.

I built Bill Orr's transmitter including the coupling capacitor. Worked fine in this past AWA LC Contest. See http://w0vlz.blogspot.com/search/label/1934%20transmitter

Hi Mike,

I'm very interested in how you determined this was a replica and not something that was "mostly original" with perhaps a few replaced or added parts? I remember listening to some Catalin collectors at the AWA fleamarket a few years back. They were showing some very subtle details in a cabinet that proved it was repaired or contained a new replacement section on the cabinet. I saw nothing unusual myself. I guess that's why I'm not a Catalin collector, hi. They sure are pretty but spending that much money on a standard BC radio was not in the cards for me.

Was there an F&H Radio Laboratories receiver that looked like this replica? I want to get some education on this. Yes I do see that those HEX spacers and mounting screws are probably new items, but beyond that I'm lost.

Thanks es 73

Exactly. Those were the two obvious things I noticed even as I bought it. The hex spacers and the small gauge bus wire. The other, not so obvious from the photo, but, suspect, is the platform it is built on. It is not the type of material typically found in 1920's radios. Nor hard rubber and not Bakelite, it is some sort of composite fibrous material and, relatively new. The piece of wood that it is on is a nice new piece of oak. The name tags on the phone jacks is another. The antenna post is marked "A" but the ground post is marked "E". Typical of European sets. Of course being from Fargo, that could be a Canadian influence. Lastly, the filament rheostat dial is wired backwards, and the knob should be on the other side. In other words, if turned towards the off position the filament voltage increases rather than decreases. The construction underneath looks old, but, it is not, but, a good attempt to make it look old. I do not blame the seller as he did explain it the best he could. So, like I said, it was probably built by someone around 30 to 40 years ago. I never heard of F& H Radio Laboratories, and it is not listed in Alan's books either. More than likely the maker's initials. It will be fun to see if it plays. 73 - Mike

Don -

The CQ back issues ARE available on-line at

<http://hamcall.net/cqcgi>

It's a subscription service, $5 for 24 hours access, $20 for three months, $50 for one year, etc.

I did an FBTO search on Orr, and got 376 articles in the various magazines, and that just goes through 1990...!

He also did an excellent series in the short lived "Ham Radio Horizons".

Someone said there was a compendium of the "Golden Age" articles that he ran in various magazines, but I've never seen one. Nothing comes up on ABE Books or Amazon.

Nice tip on the book Eddy!

I use Amazon and Abe Books for used books, but neither brought up
a result on that title. Any way to confirm?

As an aside, I have, after the passing of a friend, Bill Orr's former Gross CB-25 TX.
Interesting story behind it. http://www.w1ujr.net/w1fpz_gross_cb-25.htm

Cordially,
Bruce J. Howes

Bummer Mike, sorry about that.
Great looking set however.

As you said, most likely no one trued to pull anything over,
someone may have built it a a replica, then as these
things go, passed on, someone found the set, did not
know the provence, etc.

Cordially,
Bruce J. Howes

>
> Exactly. Those were the two obvious things I noticed even as I bought it. The hex spacers and the small gauge bus wire. The other, not so obvious from the photo, but, suspect, is the platform it is built on. It is not the type of material typically found in 1920's radios. Nor hard rubber and not Bakelite, it is some sort of composite fibrous material and, relatively new. The piece of wood that it is on is a nice new piece of oak. The name tags on the phone jacks is another. The antenna post is marked "A" but the ground post is marked "E". Typical of European sets. Of course being from Fargo, that could be a Canadian influence. Lastly, the filament rheostat dial is wired backwards, and the knob should be on the other side. In other words, if turned towards the off position the filament voltage increases rather than decreases. The construction underneath looks old, but, it is not, but, a good attempt to make it look old. I do not blame the seller as he did explain it the best he could. So, like I said, it was probably built by someone around 30 to 40 years ago. I never heard of F& H Radio Laboratories, and it is not listed in Alan's books either. More than likely the maker's initials. It will be fun to see if it plays. 73 – Mike

Garey, we must have been searching at the same time!
Usually you do get a hit there, but perhaps it was just
not popular enough to that widely available. Kind of like
the Kurt Sterba "Aerials" series.

I used the CQ back issue service a few days ago,
good quality scans, quick to download high res,
much better the the old QST scans.

Sure wish they'd offer a PDF of the book Eddy mentioned,
would be well worth it!

Don -

Interesting..... Of the 376 entries in FBTO, 303 are in Ham Radio Magazine. Six entries in QST, and 15 in CQ. The rest are in journals and other publications.

The ARRL index shows 42 entries in QST and 542 in Ham Radio Magazine. The CQ Archive shows 409 entries for "Orr, William", but that includes Table of Contents listings.

Ham Radio is of course available on CD. I have the set, and the scans are perfect. Actual PDFs instead of the low resolution images on the QST CDs. The QST CDs for the 70s and 80s are just about useless they are so bad.

Niel,
Nice job on the '34 TX.

Jim,
I noticed the omission in the schematic some time ago. I've also planned to build this rig but just haven't got that 'round tuit" yet.

John
KB7NRN

I built Bill Orr's transmitter including the coupling capacitor. Worked fine in this past AWA LC Contest. See http://w0vlz.blogspot.com/search/label/1934%20transmitter

Nice tip Jim!
I have that TX, will have to check!
http://www.w1ujr.net/1934_homebrew_tx.htm

Mine was not completed, and had some wiring errors, yet it had won a Matlock award for its builder.
Finally got it going last year, fun project, based on Bill Orr's article.
Bill's metering layout was a bit different than the builder of my rig, but otherwise the same thing.

I think I might have one of your regen sets Jim, built up some years back, at least 12-15 years ago,
and was placed in the AWA Auction?

Cordially,
Bruce J. Howes

I too have the HR CD, plus all the hard copy issues. My all time favorite "new" ham magazine, although Communications Quarterly and now QEX do carry on the tradition pretty well. Albeit not vintage radio related! I opted for the bootleg HR copy on two DVD's in pdf format that was selling on eBay, hi. If I can find my missing Vol 1 #2 of Short Wave Craft I'd consider making a PDF scan of those and putting it on DVD. Although something tells me the Gernsback publications are all probably copywrite protected still. To bad as there are tons of regen and many transmitter projects in those from 1930-1935.

Topic: 225 Message: 264

Well...
In appearance mine is fair but all there.

Theoretical content it's pretty good from what little I've read (just look at the pictures).

Projects (lots of pictures!), probably easier to still find most parts for a vintage set and a bit more
modern but still that old timey look.

John
KB7NRN

Rate it in what area Lou? Appearance of cover. Theoretical contend. Projects. It's my "favourite year"

Oh and BTW, there's Taylor T-55 project in my '38 edition... Prime example...

Oh and BTW, there's Taylor T-55 project in my '38 edition....So you are correct in assuming that the tube came out in the late '30s Hay, got sumpin rite! Tks...

That's a nice looking rig there Bruce. How does it play?

Jim,
The coupling cap is there, it's a 50 uuf variable but there's not a line
on the schematic connecting it to the grids of the pair of 46's.
I mean there's just an empty space.

John
KB7NRN

I have that TX, will have to check!
http://www.w1ujr.net/1934_homebrew_tx.htm

Cordially,
Bruce J. Howes

As I recall there may be an omission in the schematic diagram. There is no coupling capacitor shown between the plate tank of the oscillator and the grids of the amplifier. Make sure you put one in if you are duplicating the rig.

Jim, W8KGI

Thanks Niel - nice find. No, I do not think Phil made this, he would have done a much better job. Still have to go up and visit Hugo one of these days. He is always calling me to invite me, but, I have not made it up yet. I remember one time when a bunch of guys from the AWA were going to a meet out on LI and decided to stop in to see Phil. Bruce hated his guts for all those repros he was making, so, he stayed in the car the entire time when the rest of the gang went in to see all of his goodies. Besides his repros, he had some real nice stuff. Thanks again for finding the site. 73 - Mike

Jim,

You are correct! The schematic indicates no coupling between the
oscillator and PA stages.

I made Bruce W1UJR a copy of the article a few years back. He not only
has the article, but a (reproduction) example of the transmitter,
purchased at the Westford, MA meet several years ago.

As someone pointed out, more correctly it's the connection from the
coupling capcitor to the grid that's missing, not the capacitor itself.
I need to be more careful.

Photos of the scene at the office this morning!

I lost power at the house at 11:30PM last night, still not back on.
Thankfully my skyhooks kept the 160 meter dipole in place at the house.

A DX-35 will make you contacts under favorable conditions, of course, but it's only about 8W-ish carrier output on AM because it's screen-modulated.

Tks Larry all noted. The parts question does seem daunting tho out here in the hinterland. You live near the centre of the OT radio junk universe...or so it seems here.

True, but a plate-modulated 6146 provides roughly 4X the RF power output
of a screen-modulated one (as it is in the DX-35).

Impressive, Bruce. We only lost power momentarily during the night - the digital clock in the stove was reset, but my other older electric clocks were still indicating the correct time.

I had water up to the bottom of the oil furnace in the cellar last night, but set up the customary siphon and it was down to a few puddles 2 hours later. Beautiful day now; gonna go outside and do a ten mile loop on my bike.

BTW, can any member send attachments through this reflector, or is it just the privileged elite? ;-)

Hello Lou and everyone else on the list,
I feel proviledged to be a listmember here, since I'm among quite a few knowledgeable people, to say the least!

Let me know what I can do to help out, and don't forget the AWA "Topband" net every Monday evening at 8PM on 1945KC LSB or AM. It would be great to have anyone new join us. We usually discuss technical topics related to our interest, but the conversation can go anywhere that the group chooses.

I'm your net "out of control" person, so lets be hearing you, or more of you.

Mod-U-Later,
Joe Cro N3IBX

We all used to put labels on our crystals, as they were much easier to see than the original marking on the FT-243. If it is a military crystal the frequency was often not shown, but, only a channel designation was given. In other cases where the crystal may have been used in some VHF rig, the crystal may have been marked with the final output frequency and not the fundamental. Additionally, receive crystals were often marked with their exact frequency, but, were offset by the IF, so, if used for transmit you would have to either add or subtract the IF for the fundamental. The main reason, however, that we used to label crystals was because we ground or etched them to where we wanted them, so, the marked frequency was no longer valid (besides, when they came out we were all Dyno label crazy). I used to use an old BC-221 to grind/etch my crystals to frequency. And, even if a miniature crystal was placed in an FT-243 holder, it would still work if that was the frequency you needed, provided you would not exceed the RF current through the crystal. Easy enough to ask the seller, but, I see many valid reasons for the Dyno label. 73 - Mike

Lou,
I appreciate the "heads up" on the GE CG-1162's on evilbay! I have four of them and wanted to let you know they're the forerunner of the UV-202 5 Watt transmitting triode.

The CG-1162 was produced in 1918, would make a good (and historically correct) replacement for a UV-202 for those wishing to build something with that particularly tube. The real bonus is that they usually only command about 1/3 or less than the price of a similar UV-202. The CG-1162 and VT-14 were used as transmitting tubes in the (I stand corrected on this) SCR-68 radiotelephone submarine chasers at the end of WWI, and possibly other sets.

Just as a point of interest: "Uncle Dave's" Amateur supply store in Albany NY was selling them for something like .40 cents each in 1931/32 as USN surplus, per a listing in one of his advertisements in QST of the day. That was a real deal, even in those darkest days of the Depression. You'd get almost the same power as a #10 bottle, for a small fraction of the price. I would suspect that any surviiving NIB CG-1162 may have been from the same lot.

Just a "FYI" for any of us that may be interested in the one on evilbay. I won't be bidding against you since I already have a ample supply of them for future projects, so "bid up" and enjoy the auction - hi hi!

Mod-U-later,
Joe Cro N3IBX

Hate to correct brother Joe - but- the CG-1162 was never used in the SCR-68. I used to have an SCR-68 and it used three VT-1s in the receiver and two VT-2s in the transmitter. The CG-1162 was not really used in too many rigs, considering the abundance of them available even now. I must have at least 10 of them new in original boxes. Kind of like the TB-1 rectifier (also very common) except with a grid. The CG-1162 is of course the Navy's designation while the VT-14 is the Army's. 73 - Mike

From: Niel - W0VLZ
Topic: 309 Message: 318

Below is the response I got from the seller when I asked if the crystals were repackaged, reground or original. Given the variety of frequencies I bet these are reground rather than repackaged with a modern crystal inside. Also a plus is the use of his call as an ebay ID. Niel

****
We have been selling crystals for over 30 years, mostly at Hamfests before ebay came along. Most are original crystals, some have been etched by a chemical process to take them to the exact frequency (this takes a lot of time and patience), a few have small cans in them, those freqs are: 7200, 7159, 3960, 3932, 3687, 3579, 3582, 3575. Most of these are not up for auction this week or are already long gone. I don't open every one to check them. We test with a frequency counter and check for activity. If the activity is low we open them and check the spring or maybe change the crystal blank with a better one. Sometimes we replace an old dirty holder with a clean one and use dymo tape on top for the correct frequency. We have 100% feedback with a lot of happy hams buying crystals on ebay for the last 10 years. If you have problems with the crystal after the sale, contact us and we will make it right. I hope this helps, XYL-K8LJQ

Howdy,

Something worthy of note was something I got from C. Bliley (son of) some years ago. As a general rule FT-243 type crystals have a tendency to rise in frequency with age. Some will quit oscillating because of minute quantities of quartz dust within the holder. If memory serves me, he said the plate erodes over time and thus the dust. Before anything else a good bath of warm, soapy water would be just the thing. Then do a prelim check of the frequency.

It has been my experience that the older, horizontal (Bliley BC2,BC3,LD2) seem less prone to this problem. Possibly it is the cut of plate. I am not a crystallographer so I am only guessing.

Strangely enough, I opened up one BC2 unit and found an old, Lincoln penny serving as the upper electrode! In the dozen or so BC2s I have the 80 meter units use a square upper plate and the 40 meter units a much smaller round plate. I think it was because the 40 meter xtals didn't need as much pressure.

BTW: I'd love to get hold of a Bliley Vari-X unit.

CUL, Roger/K1TG

Chuck was my college roommate for a short while back in 1965 at Indiana Institute of Technology. I changed roommates, HI. However, Chuck has remained a friend and I have run across him often at AWA meets. The older crystals were certainly more predictable in their aging process and the physics of those is fairly well understood. The modern crystals however are a whole different story, for many reasons, specifically the stability required of them. Back in the 30's through even the late 60's a few hundred Hz of ageing over a short period was not objectionable or even noticeable. Now, it is catastrophic. For ham use it is still not bad. Today crystals are used for very critical timing and they are in everything. There are good ovenized crystal oscillators that can achieve better than 1 part in 10^-9 after considerable warm-up over a decent amount of time. For longer duration they are locked to either Cesiums, Rubidiums, or, GPSs. Regardless, inside the loop bandwidth of the locking mechanism, the crystal dominates. The physics of the ageing mechanism now is a lot more complex, usually random due to microcracks, and even controversial. Just thought you guys might like to know, HI. 73 - Mike

Because the seller does not know better, HI. It is a Dubilier and they mostly did make condensers as stated on the box. It is called a "Dumetohm", so, they obviously also made grid leaks for a while. - 73 - Mike

Hi gang,
     My 2 cents again....Beware the old Bud, Barker Williamson and some Millens and National coils! Some came with an early day plastic strip that goes bad with age. It will even corrode the copper coil wire itself. Rebuilding these things can be a hassle.

How true, Lou.

I might suggest a fellow I bought coils from: Conrad Warren W7WLM. The last email address I had on him was: conradwarren@....

If you provide tank circuit info he will figure the coil(s) and he sells the jack bars too. They are NOT vintage looking but are very functional. He did some work for me on the coils for my new 860 PA stage. Also I might mention that he is not cheap.

Me too. I've created an email filter and as long as the "eBay Alert" appears in the subject it files it to a sub-fold of my normal AWA folder. That way I have one location to review and organize the alerts. Keeps the email filing clean and allows for easy bulk deleting when they become very old.

Hi Lou,

The way you've been doing it has been perfect! It only looks for the works "eBay Alert" (not case sensitive) in the message subject header. Any other added text doesn't matter. I have around 100 filters running for all the different email groups and for specific people, companies etc. With several hundred emails arriving here daily and five email accounts to work with (three are business related) filtering is the only way to keep sane, hi. Thankfully all emails are handled by one application (Mozilla Thunderbird).

From: Roger Kuchera
Topic: 344 Message: 344

Gentlemen,

I am in the process of building a heavy metal power supply to power the new "100 watter" PA stage for my vintage transmitter. It will use an 860 as the bottle. I wonder if anyone in this august body might point in the right direction on two questions I have.

Does anyone know what voltages Mr. Rollins used on the 860 in his transmitter (plate, screen and bias)?

How complete was the shielding between the grid and plate circuits?

Any help would be most appreciated. I would rather not fry an 860 discovering what is needed.

Thanks!

CUL, Roger/K1TG

Should'da look at bama first...nice manual scan is at http://bama.edebris.com/manuals/philmore/nt200 Thanks Jim for the pointer.

Interesting, the NT-200 was marketed before novices had 40 or 15 meter access. As described in the manual the transmitter only covers 80 and 11 meters...also before CBers. Just a matter of winding a coil to get it on 40 but 100 pf for the pi network output cap is a lot low for a 50 ohm load. I'll have to put something bigger into the circuit and/or add another cap inside the pi network coil.

Biggest challenge will be the chassis. The original is a simple U, probably steel. With aluminum I'd want to at least add a little brace bend along each side and the bottom edges.

I love it, however, doubt if it was commercially made. Especially with that key. I may still bid on it, unless someone else on here speaks up and says they want to, because, for me, it is not a must have. I have a similar commercially made set, I'll take a photo tomorrow. 73 - Mike.

That's neat!

I'm really learning to appreciate MOPA's. I just finished one using a 6AG7 and 2E26. Made from
all junk box parts. The design is for a novice TX from Mechanix Illustrated, 1952. The article calls
out an 807 but I opted for a 2E26 since I had them on hand. Mine puts out 25 watts on 40 mtrs.

I'm attempting to end attachments through the reflector (yahoo group). We'll see if it works.

John
KB7NRN

Take a look at ebay auction
http://cgi.ebay.com/ws/eBayISAPI.dll?ViewItem&item=250588668788 I probably already have most everything for the transmitter. Does anyone have a copy of the manual they can high res scan and email to me?

Thanks,
Niel - W0VLZ

Well Bill, I am more than tempted. However, you found it, so you have first dibs. I will probably get it if I bid, regardless of price, but, I will not bid if you would like to try. However, chances are small of winning, unless as you say, you are willing to spend the bucks. Nice unit, all early, and, possibly commercial. . 73 – Mike

Hi Lou,

The way you've been doing it has been perfect! It only looks for the works "eBay Alert" (not case sensitive) in the message subject header. Any other added text doesn't matter. I have around 100 filters running for all the different email groups and for specific people, companies etc. With several hundred emails arriving here daily and five email accounts to work with (three are business related) filtering is the only way to keep sane, hi. Thankfully all emails are handled by one application (Mozilla Thunderbird).

Thanks for the support Carl. I am having a tough time deciding if I want to design a transmitter/receiver or, an audiphool amplifier. I have a lot of tubes as I mentioned previously. I could design a ham rig around 955 acorn tubes in original sockets, or, a 5 watt totally linear audio amplifier using a bunch of 4JC6A tubes. I have enough parts to make at least a 100 of each. While the ham rig with 955s is the more appealing to me, certainly the audiphool amp would yield more bucks to pay for my toys. I am beyond my means on all I have spent, and, unless I do start selling, no more toys for me - HI. 73 - Mike

Roger,

Pse remind me, where is John's 860 rig now? 73, Lou

Gentlemen,
I am in the process of building a heavy metal power supply to power the new "100 watter" PA stage for my vintage transmitter. It will use an 860 as the bottle. I wonder if anyone in this august body might point in the right direction on two questions I have.

Does anyone know what voltages Mr. Rollins used on the 860 in his transmitter (plate, screen and bias)?

How complete was the shielding between the grid and plate circuits?

Any help would be most appreciated. I would rather not fry an 860 discovering what is needed.

Thanks!

CUL, Roger/K1TG

Hi Lou, I have no idea.

If u don't get what u need from Bruce's FB video, ask Tim, W1GIG. Lou

That's why I sent it as an APB. As you know I tried to contact
several people regarding the particulars of the 860 and I got a BIG zip! I am not looking
to dupe the thing. I'd like to start testing without cooking the bottle.

Roger,

Pse remind me, where is John's 860 rig now? 73, Lou

Gentlemen,
I am in the process of building a heavy metal power supply to power the new "100
watter" PA stage for my vintage transmitter. It will use an 860 as the bottle. I wonder if
anyone in this august body might point in the right direction on two questions I have.

Does anyone know what voltages Mr. Rollins used on the 860 in his transmitter
(plate, screen and bias)?

How complete was the shielding between the grid and plate circuits?

Any help would be most appreciated. I would rather not fry an 860 discovering what
is needed.

Thanks!

CUL, Roger/K1TG

363. From Eddystone Group...Can you help?

Yahoo group: AWAGroup (2010 — 2011)

From: va3awa
Topic: 363 Message: 363

I have just started restoration of an Eddystone 358X on behalf of the SPARC radio museum in Coquitlam, BC, Canada. This receiver has had a 'hard life' and is in a rather poor condition. It has also suffered the indignity of sporting some well-meant mods, including some chassis butchering, replacement of V1 with a 6BA6 and the addition of a couple of additional stages (purpose not yet identified, but will be coming out anyway), again using miniature valves - one located behind V1 (and now not apparently connected to anything other than LT and HT) and one on a metal flange attached to the front panel, having a control pot sticking through the front panel where the original meter switch used to be. There have been many other repairs and replacements under the chassis - most capacitors have been replaced with a motley selection of failing 1950's components, as have some resistors and pots. The front panel has several holes and an extra pot fitted etc oh, and the knobs are seized on/grub screws mashed-up - lots of work ahead! ☐ a labour of love though. At least it has a full set of coils with it (but no power supply, so I need to make one up for it). Anyway, I was wondering if anyone has a photo or two of the sets innards, above and below the chassis, as it is supposed to look (the reproductions on pages 18 and 21 of the manual on the EUG site are not adequate) ☐ this would really help me make a better job of returning this old guy close to what it once was.
Thanks in anticipation,

I do not know if Bud is still alive or not. At one time I knew him real well and visited with him several times. He used to live in NJ, before I moved up here, then, he moved up to I believe to Maine upon retirement. He was a regular check-in on my 75 and 40 meter AWA nets. Had quite an interesting history in north pole expeditions and ham radio. Sadly, now, I cannot remember his call. I guess you young ones never heard of him. Bet he is often mentioned in back issues of the OTB. 73 - Mike

Were any of you at an actual "Kelley" party? I was fortunate enough to be invited to a few of them. It had to be by special invitation from Bruce only in order to attend. When Bruce got pissed off at the way the AWA started running things, he protested, and during the banquet he hosted his own at a bar/restaurant near the old museum. Come to think of it, maybe it was right across the street. Now that was an event. Bruce was a great guy, and he visited my QTH when I lived in VA on a few occasions. All the greats in AWA and electronics history used to attend. A lot more fun than the banquet was.

Hi Mike,

Way back just before he joined the ranks of the SKs, Bruce kinda took a shine to me because of my interest in pursuing copies of QST that were missing in my collection here...

He was instrumental in helping me "fill the gaps" from the excess that was in the AWA annex---and we arranged to meet & for me to collect them up & pay for them at the AWA Spring Meet.

The Meet then included an optional brunch put on by the ladies of the adjoing Legion Hall: I was privileged & honoured to be invited by Bruce himself to join his circle at a couple of these fetes. That's how I first met Bob Raide (W2ZM)...

Those sure were fun days! Bruce was rather hard to communicate with because of his failing hearing, but he displayed the enthusiasm of a kid when he took me on a personal tour of the annex.

Sweet memories!

Yep, that was Bruce. I first met him at the Dayton hamfest in 1975, along with Jim Fisk of Ham Radio magazine. I completed my first complete set of QSTs in 1975, and had several sets since. I still have an extra copy of December 1915. It appears, that while I was selling heavily several years ago someone sneaked two copies out of my bookshelf in the basement. So, now, I am missing two 1916 issues. Fortunately, I still have the May 1916 one, the second most scarce to the December 1915. I also have a photocopy of an October 1915 issue that came from Brother Pat, another good friend, which was never published, but is essentially the same as the December 1915 issue. ZM is also a great guy, I do not believe he is too active any longer. Seems like he came on the scene real fast, made a big impact, and then disappeared just as quick. I believe his son Mike is still fairly active. 73 - Mike

Great videos. You should mention that only the second needs to be watched. I really enjoyed that last shot of Dex. He is a good friend as well and has been to my NJ QTH many times, but, totally dropped out of collecting, or ham radio since he married. Probably one of the best guys behind the scenes at AWA besides Bruce and Linc. Boy, I am getting old. The good thing about getting old is the memories. And, of course, now my 5 grandchildren. - 73 - Mike

Yep, we definitely met. You and I are the same age. Fred was also a great guy and friend. I still have two AWA hats that he donated to a bunch of people at one of the Canandaigua meets. Also, at another meet he donated power strips from his company. I sold one of those Utah Jr. transmitters a few years ago to a collector from Sweden. Wish I never sold it, as with other things I have sold, but, at the time I needed the cash. 73 - Mike

Also, at another meet he donated power strips from his company. The Ham World is awash in Fred's give away pwr bars!

Yep, we definitely met. You and I are the same age. Fred was also a great guy and friend. I still have two AWA hats that he donated to a bunch of people at one of the Canandaigua meets. Also, at another meet he donated power strips from his company. I sold one of those Utah Jr. transmitters a few years ago to a collector from Sweden. Wish I never sold it, as with other things I have sold, but, at the time I needed the cash. 73 - Mike

Hi Mike,

Well, my collection of QST is short around 10-12 issues, or so, all from the teen years (naturally!)...

I've pretty much given up any & all hope of my ever completing the set---speculators & so-called "...collectors" have realized that teen year QSTs can quite readily command 3-digit selling prices on eBay, & that's just too rich for my pensioner's blood, I'm afraid...

I have page-by-page hardcopies of missing issues here, gleaned from the ARRL QST CD---but it just ain't the same, I'm afraid...

Yep, that was Bruce. I first met him at the Dayton hamfest in 1975, along with Jim Fisk of Ham Radio magazine. I completed my first complete set of QSTs in 1975, and had several sets since. I still have an extra copy of December 1915. It appears, that while I was selling heavily several years ago someone sneaked two copies out of my bookshelf in the basement. So, now, I am missing two 1916 issues. Fortunately, I still have the May 1916 one, the second most scarce to the December 1915. I also have a photocopy of an October 1915 issue that came from Brother Pat, another good friend, which was never published, but is essentially the same as the December 1915 issue. ZM is also a great guy, I do not believe he is too active any longer. Seems like he came on the scene real fast, made a big impact, and then disappeared just as quick. I believe his son Mike is still fairly active. 73 - Mike

Hi Mike,

Way back just before he joined the ranks of the SKs, Bruce kinda took a shine to me because of my interest in pursuing copies of QST that were missing in my collection here...

He was instrumental in helping me "fill the gaps" from the excess that was in the AWA annex---and we arranged to meet & for me to collect them up & pay for them at the AWA Spring Meet.

The Meet then included an optional brunch put on by the ladies of the adjoing Legion Hall: I was privileged & honoured to be invited by Bruce himself to join his circle at a couple of these fetes. That's how I first met Bob Raide (W2ZM)...

Those sure were fun days! Bruce was rather hard to communicate with because of his failing hearing, but he displayed the enthusiasm of a kid when he took me on a personal tour of the annex.

Sweet memories!

Actually, the price of QSTs have hardly changed in about 40 years. I sold my first complete set in 1976 for $3000 and used it as a down payment on my first house. A complete set of QSTs is still only worth about $3000. So, actually with the way the value of the dollar is, they are now going for less. My first December 1915 issue cost me $500 back in 1975, that is about what they are going for now. Most 1916 issues were and still are going for about $200. The 1917 are typically around $100 and the 1919 are typically in the $50 range. After that they really go down fast, with the later years mostly going into the trash as no one will pay anything for them. I have actually had about 6 or 7 December 1915 issues. Considering there were only about 600 printed, that is pretty good. There are of course many reproductions, but it is fairly easy to tell. The December 1955 issue of QST had the whole first issue reproduced in it, and, often people try to sell those as originals. I still have many dupes from the teens and the 20's. 73 - Mike

Has anyone tried negative-lead keying of their Hartley or TNT oscillators as opposed to the more normal filament resistor center-tap keying ?

I am presently building the Hull Hartley and the original physical layout presented in the handbook photos definitely favors negative-lead keying. The keying method is not mentioned in the original article but I strongly suspect that is what was done.

Now, I can see why negative-lead keying might be problematical if more than one tube was being utilized with a common power supply but, maybe I am missing something, I really can't see any electrical difference between negative-lead keying and center-tap keying, when just a single tube is used.

Has anyone tried both methods, or at least, tried negative-lead keying?

Genetlemen,

I'd like to thank you for info on the videos of Mr. Rollins' 860 transmitter. I garnered some good data from it. I'll have to figure out how to single step through the pertinent parts to study the layout and shielding.

His transmitter is a work of art, built in the long boy style. I use separate boards for each stage. I wish I could have met him!

If anyone has any still photos of the unit itself (especially the PA stage) or data on the screen and bias voltages he used, I would be obliged to those folks. Thanks again.

CUL, Roger/K1TG

Hi Roger,

The transmitter in the video is now with the AWA, it was dropped off in August of 2008.
Ed Gable or Bruce Rollinson have the keys to the kingdom there.

I'll check at home for some better photos of the rig, I may have some still shots,
the video was somewhat dark.

Cordially,
Bruce J. Howes

Well, no, I have not tried it because I have not had that much experience with transmitters of that vintage. However, the word negative keying is what we called "grid block keying" from the 60 through the transistor era. Although this keying method is considerably different from what you have in mind. To the best of my recollection, with the keying method I am talking about, we essentially shorted out the grid bias of the tube, allowing it to go into cutoff, and hence not oscillate. Maybe something to consider even with the old style rigs. 73 - Mike

When your Regen Won't

Larry NE1S visited the shack this weekend and helped me with the Doerle 2~ER set. We managed to fix the wiring errors on the coil socket, but failed to get the set to regenerate.

There was some concern the tickler coil was the wrong polarity, but that seems to be cleared up. I have both the coils which came with the set, as well as a set of Bud pre-wound coils. The Bud set had a schematic of the Doerle set, using a pair of type 30s, wired the same as my set.

Voltages were checked are right, wiring looks good, we substituted in the one fixed cap with a good silver mica unit, added additional capacitance to the throttle cap, still no joy.

Steve,

Keying the negative power-supply lead...won't you have the full power supply voltage across your key? Keying the cathode/filament tap puts some voltage across the key but it doesn't go up to the full power supply voltage. Somewhere I think I saw cathode keying puts up to the grid cutoff voltage across the key. But I didn't measure it on my Hartley so I'm not sure how high that goes.

If you do choose to key the high voltage line, the Keyall from Jackson Harbor Press can handle up to 500 volts. I added one to my ss keyer. see http://w0vlz.blogspot.com/2009/01/when-using-my-vintage-transmitter-ive.html

Yes Niel, that's true - with negative lead keying (grid returned to
cathode, with no key between) the full B+ is across the key on key up.
On the other hand, with cathode keying - where the grid circuit is
returned to a bias supply or ground (thru the grid leak resistor) while
the cathode circuit only is keyed - the voltage across the key is
limited to the cutoff bias for the tube under the conditions of use.

Bruce W1UJR also has a copy of the Hull Hartley, and as I recall there
was no built-in provision for keying - so we put the key in the negative
lead to the power supply.

Bruce,

Somewhere the instructions for one of my 29 SW regens said if it did not go into oscillation one should try a small (.001?) cap across the input terminals of the transformer. I had trouble getting it to oscillate and sure enough that made all the difference.

I'll try and look it up in more detail tonight

Hi Carl!

I can see where this might help a circuit without a throttle cap, or in a circuit where the "cold" end of the tickler isn't well-bypassed to ground. But with the throttle cap, (or a bypass there) the feedback path is completed through it, so I don't know how what you're suggest would help.

On the other hand, though, I am thoroughly humbled by the fact that we couldn't get the set to go into oscillation, with or without antenna connected, and what you're suggesting is simple enough to test, so why not?

As Bruce had said, I had verified (over and over and over again) that the tickler was phased properly wrt the grid coil.

> supply voltage across your key?

Thanks Neil - I'm not sure about that and that is one of the things I suspected. If such was the case, you would have to see full plate voltage at the ungrounded cathode wouldn't you? Maybe some positive component of this plate voltage is showing at the cathode but I'm not sure why. If the key is simply in-series with the negative lead of the power supply I would think this is a low-voltage point with respect to the keying leads but not with respect to the plate lead! Anyone keying the negative line want to measure acrosss the key for me?

Steve

Larry - just saw ur reply after posting. I guess this answers the question for me as I certainly do not like the sound of that idea. I'm still not clear on why the cathode potential is so high...I guess I missed that lesson somewhere along the line :-)

Tnx for your help Larry, you did a great job.
I've always told me staff that the simpler the design, the harder it is to troubleshoot, seems to be a case of that here.

Tnx for the tip Carl, I believe that there is a small cap on the xformer - see this photo
-->> http://www.w1ujr.net/Bruce's%20Bench%202010/DSC_0730.jpg
Looks like a .04, wonder if this could be bad?

Sad thing is that this pretty little set never worked, the coil socket was wired incorrectly,
and of coruse we have the nagging regen problem.

I'm somewhat tempted to try a standard four pin coil and socket just to see what happens.
That is the way it is drawn in the schematic, and in the 1934 Radio Handbook.

Steve,

Feedback in December, 2003 QST has more information. See http://www.arrl.org/qst/feedback/2003/12/ I'd key it with a relay (either mechanical or solid state). Second choice is to key the cathode/filament center tap and be careful.

Anyone have their '29 rig set up? Can someone do a few voltage measurements?

Niel

Bruce,
I see a 0.1 meg (or 100K) resistor and choke on the transformer but no .04 uf cap.

Have you checked the continuity of the windings on the transformer? Are all your tube sockets making good contact with the tube pins? Are all the other components close to their rated value?

John

Steve,

The full B+ is across the key - think of the tube as a resistor
connected to B+ with the other end floating (until the key is depressed).

With the grid grounded (instead of returned to the cathode) the voltage
at the cathode self-limits to the cutoff bias, because the cathode
cannot be more positive than the grid by this value without the tube
shutting itself off.

OK Larry...that is rather what I suspected but have never really thought carefully about it. I guess I will use the usual center-tapped resistor keying but the layout will not be quite so elegant. A lot of these old designs were virtual deathtraps to the unwary it seems, with B+ across the key and exposed plate coils with full voltage.

Steve,

You could eliminate the center tapped resistor completely and just key the filament center tap to ground from the power supply. If I would have had a center tapped filament transformer that is what I would have done on mine.

Lots of the WWII vintage military keys came with covers to keep the GIs out of trouble. You might find/use one of them. Remember to polarize the key properly.

yes Neil...I am in the same boat as you. It will not be a problem to add the filament resistor keying but it would have been so slick, and truer to the original, to do the negative line keying.

Has anyone tried both methods, or at least, tried negative-lead keying?

Odd that you should ask, Steve.

Late last week I was verifying a TNT project's mock-up version before going on to the final build. Not having a presentable c.t. resister, I rewired the ckt as shown in album, VE3AWA, image TNT CKT 800.

Under a full load using a receiver with 'phones I compared the signal with and without the filament resister. With the resister, the signal was as you would expect from a TNT. Yet, as wired in the circuit above, there was a quite noticable improvement in signal quality (but not output). The tone was approaching DC, any former chirp all but disappeared and, with the rx tuned to that region just outside of zero beat, I held the key down for approximately 30 seconds without hearing a change in the pitch of the received tone. Finally, I measured 50V DC across the key when open.

Now, I'm sure a CERTAIN member here with a misplaced U will throw up his hands in horror over the wrongness of all this, but there you are. Try it, you'll like it.

Lou,

Could your filament resistor not be quite the same value for each half?

Lacking a center tapped filament transformer I wonder if mounting a 20 ohm pot with the filament transformer and adjusting it for minimum hum will do the same.

Hi Lou,

I'm far from being any sort of an expert in such matters, but doesn't "negative line keying" imply something akin to "grid block keying", in that a negative voltage is used to control oscillation...?

I'm looking at your circuit, & all I can see there is an absence of equalizing resistors in the filament...

Huh...?

Hi Steve,

I don't know that I'd especially want to key the ground return of a B+ power supply like that!

Consider: in the key "up" position, you've taken away the ground return for the positive side of the supply---doesn't that imply that you now have all that potential looking for an easy path to ground, whether it's done directly, or through your anatomy...?!

I don't know, but "ground" always implied just that to me: it's all about safety, regardless of "vintage"---and in as much as we might all appreciate Ross Hull's work back-in-the-day, is there even one amongst us now who wishes to join the ranks of SKs in the manner that he did...?! I think not...

Stick with centre-tap keying, be it via the centre-tap of your filament transformer, or through one "created" with balancing resistors!

Hi Lou and welcome home .....glad to see that you have survived all of the celebration!! I have never tried keying the center tapped filament transformer since mine is lacking a C-T. Perhaps the reduced output is a result of the DC resistance introduced by the transformer windings producing some cathode biasing during keydown, effectively lowering the plate voltage a small amount.

There has been some confusion with my original question as I am not referring to 'grid block' negative keying but rather, simply keying the negative lead of the plate supply. Perhaps I should have phrased the question better. The reason for my inquiry results from the parts layout in the Hull Hartley mock-up. It appears from studying the original pics that Hull built it with this type of keying in mind as the physical layout ideally matches that method and to stray from the original layout becomes a bit messier. I may still take Neil's original suggestion and either use a covered key (which I have) or finish building my high-voltage keyer. I would love to use center-tapped filament resistor keying but Hull's original parts layout is so slick that I would prefer to keep it true to form.

While keeping things "true to form" is certainly noble, and the preferred way to go, there is also reality. If one wants to build a reproduction of an old time rig, how close will it be to original anyway? Are you going to use a piece of wood from that era, how about the screws, or the wire. Are you going to run it off of the same type of mains as was used back then? Of course, the answer to most of this is no. Striving for it is one thing, achieving it is another. Then, unless you are just going to place it on a shelf implies you are going to use it on the air. Well, bands are a lot different today than they were over 80 years ago. Most people have very selective receivers, and there are easily a thousand more times as my signals on the air simultaneously as was then. So, to recreate the whole scenario, all stations would have to be off the air, and, the only ones using it can only use 20's vintage transmitters and receivers. I do not want to sound pessimistic, but, I do believe a few mods to some circuit designed over 80 years ago, and intended to be used today, is allowed some flexibility. 73 - Mike

Hi Steve.

Why couldn't you keep Hull's layout of the XMTR set proper as it is, and put the filament resistors on the power supply board/chassis/box/whatever (which you need with any keying method you choose anyway), and key the electrical center of the filament winding (i.e., the junction between the two resistors) to GND at the power supply? In other words, plug your key into the power supply instead of the XMTR.

Or am I missing something?

Hi Steve,

"...Look at most of the regen rcvrs of the day, running B+ through the phones...talk about an electric chair!"

****

Indeed...!

I recall an AWA "offsite" meeting years ago at Fred Hammond's (VE3HC) museum in Guelph, Ontario. Fred personally told me a sad tale from the late 40's when a good friend & prominant Ham of the day "earned his wings", so-to-to-speak, that very way.

Unbeknownst to him, the B+ blocking capacitor between the unfortunate Ham's headphones & Valhalla had shorted, and when the poor guy reached for a panel-mounted toggle switch, it was all over for him...

I agree that it's great to strive for period "realism" in our vintage re-creations, but this HAS to be tempered with at least a nod to modern safety. Example: in my regen receiver, I HID a plate-to-voice coil audio output transformer BENEATH the chassis! No one need be the wiser for it, save for you---and the spirits of those unfortunates who've gone before us, of course...

Hi Guys,

Well, the homebrew tube-type electric guitar amplifier that I'm working on for benefit of my son is in "the paint shop" here. The chassis & bottom plate has been primed (all of the holes & cut-outs are done, of course), & I hope to apply one topcoat to-morrow...

Which leads me to my next project (naturally!)...

I think I may have mentioned before that I wanted to build a 5-tube (all 12AU7A's) W9TO-style electronic keyer here...well, a deal for a vintage EICO 717 came up that I simply could NOT refuse, and so I'm reverting to "Plan B" now, i.e. an "updated" W9TO keyer, but with 1929 tubes...!

I envision TEN type 227 triodes(!) here, with a 280 rectifier. The 17.5 amperes of 2.5 VAC filament voltage will have to be secured from a combination of parallel AND series-string hook-ups...

This thing will be BIG when done, and a LOT of fun to use & show-off & brag about at get-togethers. No, it won't be "historically correct" by ANY stretch of the imagination, but I'd still have every intention of using such a behemoth on the occasion of the 2010 Bruce Kelley 1929 QSO Party...!

"Ah, blessed CW! Code by any method of generation would sound as sweet!" Hi Hi (sincere apologies to Bill Shakespeare---or whomever!).

Niel,

Could your filament resistor not be quite the same value for each half? Yes, that is correct. Although in very good external condx, the ctr is anything but ctr.

Lacking a centre tapped filament transformer I wonder if mounting a 20 ohm pot with the filament transformer and adjusting it for minimum hum will do the same.
Sounds reasonable to me, but for ur 10 you'd use a 75-100 ohm, right?

73, Lou

Eddy,

I am discussing filament c.t. keying, not grid block or negative line keying. That was my understanding of what Steve was talking about. Lou

I'm far from being any sort of an expert in such matters, but doesn't "negative line keying" imply something akin to "grid block keying", in that a negative voltage is used to control oscillation...?

I'm looking at your circuit, & all I can see there is an absence of equalizing resistors in the filament...

There has been some confusion with my original question as I am not referring to 'grid block' negative keying but rather, simply keying the negative lead of the plate supply. Perhaps I should have phrased the question better.

Oops, I should pay more attention. Think I'll stop while I am behind.... Lou

While keeping things "true to form" is certainly noble, and the preferred way to go, there is also reality.

Here is a "reality". I have a breadboard I am saving that came from a circa 1920 kitchen table. Brass round or flat head wood or machine screws of pre-China manufacturing takeover vintage will do nicely. Wire? #15 d.c.c hook up and 1926-7 radio store purchased 'real' square buss wire. Parts? Easy. Get Mike to adopt you. DAD!

Are you going to run it off of the same type of mains as was used back then? ....

All the rest here has no bearing on anyone's reality. None of us are that odd. Well, maybe E...

Lou,

You're right. I used a couple of 40 ohm resistors. The exact value is pretty flexible, though, as long as they are the same. Hull calls out 50 to 200 ohm resistors in his article. Guess whatever pot is in the junk box in the range of 100 to 400 ohms total that can handle the power.

Recapping, the idea is to remove the resistors from the transmitter, add a 100-400 ohm pot in the power supply across the filament transformer secondary and connect the key to the power supply between the arm of the pot and ground. Adjust the pot for least hum.

I have used a couple of matched 100 ohm in my PA (2 X 10 tubes) as you say the value is not very important but it will add a bit of bias so don`t forget to bypass with a couple of 1000
pF caps. Because of this I prefer to put the resistors at the TX end rather than in the power
supply.

Hi Pat!

The RF circuit is through the bypass capacitors, which should be right at the tube socket, to keep the RF path as short as possible. But the filament resistors provide only the DC path (assuming said previous filament bypass caps are sized, chosen, and installed correctly), so why can't they be remotely located in the power supply?

Good question, Lou.

Here's the way I see it. The lead length to the power supply will be a variable depending on the individual circumstances. The parasitic inductance and stray capacitances of the filament leads to the power supply, although smaller at 160M than 80M, and smaller at 80M than 40M, etc., etc., are present, and they WILL radiate to some degree in the shack. This makes more likely problems associated with RF mixing with the filament AC supply and modulating the output with 60Hz and harmonics thereof (i.e., creating a nasty note. This also means less RF going to the antenna, but its probably by a small amount and therefore less of a reason). You leave yourself open to a Pandora's box of issues when there is no need to: it's just so easy to use a pair bypass caps right at the tube socket. And if you use period micas, they're pretty, too ;-) By doing this the RF is no longer carried by these leads; they are only providing the 60Hz AC to the filaments and providing the path for the negative DC (the latter assumes either the resistor "tap" or fil xfmr center-tap method of keying is used at the power supply).

Short answer: You do it for the same reason a dog licks himself - because you can ;-)

438. Jones PP TX with 6A6

Yahoo group: AWAGroup (2010 — 2011)
Date: 2010-03-12 01:56:53 UTC
From: john_kb7nrn
Topic: 438 Message: 438

I recently built a couple breadboard transmitters based on the Jones PP TX from one of his '30s Handbooks. The first one was built with all junk box parts and used a 6N7 dual tiode and works well. It's built on a very small board, about 5" x 6". Because of this there seems to be too much feedback on 80 & 40 mtrs and the crystals are heating, HC6 & HC49. Regular FT-243 and larger xtals work fine on 80 but still "yoop" a little bit on 40. So I just set it up for 160.

The second one is more vintage looking. I tried a RK34 but it didn't work well at all. Rewired the plates for a 6A6 and boy does it work! 10 watts on 160 - 40 mtrs with one tube!

The breadboard is much larger and I shilded the underside with heavy aluminum foil. This keeps the RF out of the grid circuit pretty well and I can run HC6 & and HC49 xtals, of coarse they are hidden in older style holders.

You can view photos here http://antiqueradios.com/forums/viewtopic.php?p=1065526#1065526
You can go back to the first page of the thread and see the shematic and the little 6N7 TX.

Pretty simple rigs to say the least.

My 2 cents.....Be careful of the brass (extruded ?) it tends to get brittle and will crack
or split with rough handling.

My 2 cents again.....The problem may stem from the "drawing" or extrusion of the case in the original manufacture. I believe it is called "embrittlement." I have run across this problem in some older General Electric meters but I did find a later Phenolic case which fit perfectly. Unfortunately I don't remember what the Phenolic case came from. If it is old enough to have a brass case, it may have a metallic zero adjuster.....Be Careful!!!!

Yes! The inner case is cracked on mine - which makes me not want to do handle it much at all. Fortunately, the outer shroud hides the cracks.

Gentlemen,

I'm sending this as an All Points message:

Being an FBXA owner I have standing "Wanted" ads out looking for coils. Several weeks ago I was approached (via email) by a seller (?) in the UK. He said he had the ones I was looking for in stock all for princely sum of GBP 100. He signed the email as "Thomas Crown." The hair on my neck immediately stood up and the word "Scammer" came to mind. Beyond saying I might be interested, no further contact has been attempted.

Forewarned is forearmed. BEWARE!!

CUL, Roger/K1TG

I agree. The deep drawing of brass was not well understood all those years ago and cracking is a frequent result.
As a matter of interest brass radiatior shells on pre-war cars (usually chrome plated) were often made by powder technology and any attempt to hammer out dents can result in disaster!!

460. 1928 Cardwell Catalogue

Yahoo group: AWAGroup (2010 — 2011)
Date: 2010-03-14 02:41:16 UTC
From: va3awa
Topic: 460 Message: 460

Hello,

I have made a high-rez scan of a circa 1928 Cardwell Catalogue, 36 pages, 71/2 X 101/2" format. Each page averages 1MB.

The first 16 pages features articles by Allen D. Cardwell covering condenser theory, extensive information on the design of variables and, of course, why Cardwells are, "The Standard of Comparison".

Twelve pages featuring the complete Cardwell line of that day. These pages include photographs and excellent line drawings plus graphs and text.

The remainder of the catalogue covers other products offered (Pyrex antenna insulators/standoffs. CU ribbon helice stock selling at .10/turn. Variable mounting brackets etc. etc.) plus formulas, properties of magnet wire and dielectrics etc. etc.

If you wish a copy, I will be happy to e-mail it to you or will, for the cost of postage (and a possible envelope) send you a CD.

For two sample pages go to Files and click on "Cardwell Catalogue".

73, Lou VE3AWA

468. Doerle Regen That Didn't Now Does

Yahoo group: AWAGroup (2010 — 2011)
Date: 2010-03-15 02:16:55 UTC
From: Bruce W1UJR
Topic: 468 Message: 468

Ok, confusing subject line, so let me explain.

The little Doerle set which I picked up at the radio meet near Boston last month is now working.
Thanks for the numerous replies and suggestions, and tnx esp. to NE1S for his help on and off site.

Tonight I figured I'd make things just like the article and remove the 6 pin socket and coil
with the antenna winding. Thought I'd just install a simple 4 pin socket and "standard" coil
as a test measure. Had the parts on hand, real easy to do.

So, about 30 minutes later, I fired the set up with the 4 pin socket, and like magic, it was playing beautifully, slipped into and out of regeneration very easily. Selectivity was nice, sensitivity even better, was pulling in Euro stations with a 12 inch clip lead on my bench.

Not content to leave well enough alone, I reinstalled the 6 pin socket and coil.
Guess what....the set played! In and out of regen, though it has problems with the higher bands (lower freq.), seems to run out of adjustment on those bands. But 40 meters working very nicely.

So what happened? Candidly, I'm not sure. I did find the ground connection, which is made through the wooden board via a metal tube stand off some what loose. Was that the cause, guess we''ll never know, planning on leaving the 6 pin coil and socket in as it seems to work ok.

I do need to install a larger throttle cap, seems the one which I have is a bit too small to cover the top bands. Will look for one.

But in the meantime, if someone has a Hammarlund .00025 mf air variable, shoot me an email.

In any case, wanted to update those who might be following this misadventure!

Cordially,

Bruce -

Seeing your Doerle set, the Reesonator that I bought:

http://cgi.ebay.com/ws/eBayISAPI.dll?ViewItem
<http://cgi.ebay.com/ws/eBayISAPI.dll?ViewItem&item=230437194836&ssPageName=
STRK:MEWNX:IT> &item=230437194836&ssPageName=STRK:MEWNX:IT

and this Reinartz that was recently sold:

http://cgi.ebay.com/ws/eBayISAPI.dll?ViewItem
<http://cgi.ebay.com/ws/eBayISAPI.dll?ViewItem&item=380213576308&ssPageName=
STRK:MEWAX:IT> &item=380213576308&ssPageName=STRK:MEWAX:IT

and even possibly this Apex:

http://cgi.ebay.com/ws/eBayISAPI.dll?ViewItem
<http://cgi.ebay.com/ws/eBayISAPI.dll?ViewItem&item=380214130100&ssPageName=
STRK:MEWAX:IT> &item=380214130100&ssPageName=STRK:MEWAX:IT

I see a lot of similarity. They all appear to be of recent manufacture, yet, based on actual names and circuits. Your Doerle and my Reesonator at least came from a different source than the Reineartz or the Apex, but, my Greenwood breadboard came from this place as well. They also sold, or have several crystal sets that were obviously copies. Just an observation.

Glad you got the Doerle playing. As you know, this stuff is not magic, yet it can get frustrating at times. 73 - Mike

Subject: [AWA Group] Doerle Regen That Didn't Now Does

Ok, confusing subject line, so let me explain.

The little Doerle set which I picked up at the radio meet near Boston last month is now working.
Thanks for the numerous replies and suggestions, and tnx esp. to NE1S for his help on and off site.

Tonight I figured I'd make things just like the article and remove the 6 pin socket and coil
with the antenna winding. Thought I'd just install a simple 4 pin socket and "standard" coil
as a test measure. Had the parts on hand, real easy to do.

So, about 30 minutes later, I fired the set up with the 4 pin socket, and like magic, it
was playing beautifully, slipped into and out of regeneration very easily. Selectivity
was nice, sensitivity even better, was pulling in Euro stations with a 12 inch clip
lead on my bench.

Not content to leave well enough alone, I reinstalled the 6 pin socket and coil.
Guess what....the set played! In and out of regen, though it has problems with the
higher bands (lower freq.), seems to run out of adjustment on those bands. But 40
meters working very nicely.

So what happened? Candidly, I'm not sure. I did find the ground connection, which is made through the wooden board via a metal tube stand off some what loose. Was that the cause, guess we''ll never know, planning on leaving the 6 pin coil and socket in as it seems to work ok.

I do need to install a larger throttle cap, seems the one which I have is a bit too small to cover the top bands. Will look for one.

But in the meantime, if someone has a Hammarlund .00025 mf air variable, shoot me an email.

In any case, wanted to update those who might be following this misadventure!

Hi All,

Do you remember the legendary W2OY's famous CQ call on phone, that was sprinkled with repeated & specific reference throughout as to no "...LIDS, KIDS, SPACE CADETS"...?

Well, my friend Bill (VE3CSK) e-mailed me a voice snippet of that phrase, right from the master's voice himself. If anyone might be interested in getting a copy, just lemme know...

Tnx Coop, just wish I knew what really "fixed" it.
May have been that loose ground feed through, still not sure if that was
really loose with the original set up.

I tested again before I left for work this AM, just to be sure it was repeatable,
the set is still working, and really pulls in signals with the 12" test lead.

When it started playing on the 4 pin socket, I knew at least the rest of
the set was wired correctly, gave me the incentive to get it working
with the other coil/socket.

I do need to attend to the larger throttle cap to I get it on the higher bands.
Sure that I'll dig up one at the upcoming radio meets.

Don't think you need to worry much John.

Mike became a silent key at least 30 years ago.

I think we are losing the younger set due to competition from
the internet, video games, and cell phones.

For many, radio has lost its magic or holds no appeal to some
folks given the other options. But its not just younger hams,
many of the older hams are going the way of the "shack on the belt"
with HTs, or just losing interest in the hobby. You can win small
victories in this, but its not a trend which can be reversed, just a fact of life.

Generally we all are working harder and have less free time.
Interest in radio, and other fraternal organizations is way down.

That's my 2 cents.

Hi John,

Bear in mind that the op in question joined the ranks of the SKs in 1967---it was a different Amateur radio world in his day...

Still, I wish more than a few "...lids, kids, & space cadets" would take-up stamp collecting, rather than messing-up the frequencies of some of the choice DX I've been trying to snare on 160...

OM W2OY may well be gone, but he's left the lids, kids, & space cadets behind!

In 1957 I returned home from high school (a two mile walk, up hill both ways) and found my mother had stuck in the door the much awaited letter from the FCC with my brand new General ticket. I ran upstairs to my shack and turned on my already prepared "phone" rig, a Globe Chief 90 with home brew 6L6 modulator. As soon as the filaments warmed up on my WW2 Navy surplus NC-120, there was W2OY calling CQ right on my Xtal frequency. Upon throwing the TX switch I said "W2OY, W2OY, W2OY this is W2MPM, W2MPM, over" He came back literally shouting "You don't have to give my call three times, I know my callsign, are you a lid or a kid... at least you have a W2 call..." And that was my introduction phone and W2OY. He wasn't a bad guy, really, he made a lasting point !! As a side, one of the AWA founders was Linc Cundall, W2QY. Linc was a member of our old FD group and at one outdoor setting I found a roll of blue electrical tape. As our NY license plates used to be blue with orange letters, it was a simple matter to make an O out of the Q on Linc's license plate with the blue tape. Those of you who knew Lincoln knew a soft spoken, true gentleman of the old school. NOT when he saw his license plate though.... he didn't think that was too funny. Thanks for the memories. 73, /Ed k2mp ex-w2mpm ex-I1DFD still WPE2JR

John,

I made the mistake of calling Mike back in the good ole days. Didn't bother me much and I've been at it for over 50 years. You don't have to tune around much, now days, to find comments being made that are much worse than ole Mikes. Mike and others like him were just the ham radio characters of the day. Some of the ones today are well beyond that term.

We are loosing the younger set to cell phones, ipods and all the other high tech gadgets available for communications. Just my humble opinion...hi.

This weekend I had a chance to take some voltage measurements across the key of the PP '45 TNT rig configured for both methods. Suypply voltage was measured at 405V. A high-input resistance DMM was used so as not to draw current and key the oscillator:

Cathode keying :105V (about what I'd expect for cutoff voltage for a '45 with 400V on the plate)
Negative lead keying: 404V (essentially full supply voltage)

As for the "VA3AWA" part of the subject line, I have no comment! ;-)

****

Hi Larry,

That's about what I'd expected---kinda dangerous proposition to key THAT sorta voltage a mere inch, or so, away from one's pinkies...BUT!

There IS a safe alternative to those who might care to try it, AND take advantage of (as Lou claims) the superior keying characteristics of this methodology...and the answer is, key the negative line by way of a remote relay.

Any 6.3 VAC open-frame relay will do the trick: mount it right inside the power supply, if you wish, and be sure that the contacts are far enough apart that the thing won't arc on you.

As for a key click filter, well, you're on your own there---and an anti-sparking resistor in series with a capacitor directly across the keying line (on the relay side, I believe...?) would probably definitely be the order of the day...

Could be a most interesting project, bar none---but with precautions, NOT worth joining the SK club for!

>apart that the thing won't arc on you.

At any rate, a big old keying relay would sure sound nifty!

BTW...I don't think Lou was ever proposing the virtuous of B-
keying...didn't he just key the center-tapped filament winding on his
recent TNT mock-up?

While work on the Hull Hartley progresses nicely, I am looking ahead to the next build...a slightly stylized version of "The Longfeller". I would love to use the B&W 'Baby' sized end-link coils in the final but I just have this one for 40m:

http://members.shaw.ca/ve7sl/40mbaby

I'm hoping that somebody may have the odd one(s) for some of the other bands kicking around that they would like to sell off?

On the other hand, if you have a few and need my 40m one to complete a project, I can always wind some plug-in coils!

BTW...doesn't the price on the box make you weep :-(

Hi Lou,

I never said that B- keying was found wanting in safety. I was merely
taking the measurements Neil had requested earlier, which confirm what
theory predicts.

As for your other comment, I'm afraid you're over my head there, OM.

Ed and all,

The thought of what must have been a very nice RAO (being only 12-15 years) old brings to mind "in the best tradition". I have always thought with much nostalgia about the the days of Ham Radio from right after WWII through the 60's. Were they better days ? I don't know that better really is the word, but there sure was a lot of good surplus. Sure of that! Reminds me of when I was a kid in Cincinnati Ohio, where Lapirow Brothers ran a great Surplus Circus which occupied many a Saturday morning when my good friend Bill and his father, K8WQA and I used to haunt Hymies emporium handling everything from gun sights and aircraft propellers to the sweetest in-the-box 328s and command sets. Hymie used to put on a show for everyone when he preached the religion of consumption from the pulpit of his warehouse of war weary treasures. Well, maybe better isn't the word, but good will do. In any event, I no longer live in Cincinnati, having traded a river for a lake and rain for snow and no doubt Hymie has passed on. Lapirows went out of business many years ago. You know, I think I will just look around for a good RAO on EBAY.

> In 1957 I returned home from high school (a two mile walk, up hill both ways) and found my mother had stuck in the door the much awaited letter from the FCC with my brand new General ticket. I ran upstairs to my shack and turned on my already prepared "phone" rig, a Globe Chief 90 with home brew 6L6 modulator. As soon as the filaments warmed up on my WW2 Navy surplus NC-120, there was W2OY calling CQ right on my Xtal frequency. Upon throwing the TX switch I said "W2OY, W2OY, W2OY this is W2MPM, W2MPM, over" He came back literally shouting "You don't have to give my call three times, I know my callsign, are you a lid or a kid... at least you have a W2 call..." And that was my introduction phone and W2OY. He wasn't a bad guy, really, he made a lasting point !! As a side, one of the AWA founders was Linc Cundall, W2QY. Linc was a member of our old FD group and at one outdoor setting I found a roll of blue electrical tape. As our NY license plates used to be blue with orange letters, it was a simple matter to make an O out of the Q on Linc's license plate with the blue tape. Those of you who knew Lincoln knew a soft spoken, true gentleman of the old school. NOT when he saw his license plate though.... he didn't think that was too funny. Thanks for the memories. 73, /Ed k2mp ex-w2mpm ex-I1DFD still WPE2JR

73's Rw W2IT

I was also a kid in the Cincinnati area, graduated from St. Xavier High School in 1956 when it was downtown at 7th and Sycamore. I visited Hymies, Mytronics up near WCPO-TV, and of course Steinburgs over on Walnut Street which was just a couple of blocks from school. In those days, thanks to the availability of surplus items like Command Sets and old radios and TV sets that could be picked up for next to nothing from family members or appliance stores, a kid could get on the air for about $25. That could easily be earned in a month or so by cutting lawns and shoveling snow. I helped a buddy of mine from St X get on with a Howard 435A receiver, about $5 from a friend in Boy Scouts who had lost interest, and with a Heathkit AT-1 that his mom donated to the cause. We later found a well-used BC348 at Mytronics for $20 that upgraded his station.

Those were indeed good times!

From: Bruce W1UJR
Topic: 511 Message: 511

Anybody else catch this, interested in going?

I think it would be well worth driving down, John weaves a good story,
and if you've been following this in QST, think it will be well worth your time.

I'd like to go, and have room to bring other folks down from the New England
area on my drive south from Maine.

If interested, let me know, sounds like a very FB outing!

73 Bruce W1UJR

==========

Saturday April 10 at 10 AM.

Hi Gang,

Here's the info I have on my presentation time on Saturday April 10 at 10 AM.

Please RSVP if you can make it. The K1USN group would like to know
how many are coming.

RSVP (click) mailto:pi.k1rv@...

Program - Slide show and Presentation taken from Don Mix's daily
journal - Length, about 1-hour:

WIRELESS NORTH POLE,THE ADVENTURES OF DON MIX
by John Dilks K2TQN

Imagine for a minute you are a young 21 year old ham living in
Connecticut with your parents. You have recently completed your
schooling and are thinking about a career in radio. Self taught, you
are able to build or troubleshoot any radio circuit; you have honed
your Morse skills and are one of the top radio operators around, well
known by your peers. So what are you going to do? It is early winter
1923. You receive an invitation from Hiram Percy Maxim to apply for
the position of radio operator on an expedition in an 88-foot
schooner to the North Pole for one year.

Frozen in the Ice for 12-months, life was hard and exciting for Don the crew.

73, John Dilks, K2TQN

Location info:
The K1USN Clubhouse is located in the Thomas Watson building on 85

Quincy Ave in Braintree, MA. The presentation will take place at 10 AM in the lower level of the building which is handicapped accessible.

We will be conducting a VE session upstairs at 9 AM and expect some of those people to attend as well as other K1USN members. You certainly can extend an invitation to AWA members as well as Donna Halper.

The K1USN Clubhouse will be open at 9 AM for visitors who arrive early and W1QWT plans to be available to discuss the vintage Navy gear he has restored.

We should be able to handle all the AWA members that wish to attend. We plan to provide coffee, etc so it would be nice to have a rough idea on the numbers.

We have a gathering of local hams every Saturday morning at 7 AM at the Holiday Inn on 228 in Rockland, MA. It is located near the Rte 3 exit for Home Depot, Exit 14.

I plan to be at the breakfast and some of us will be going from breakfast directly over to K1USN.

73,

Pi - K1RV / K1USN

Cordially,
Bruce J. Howes

Howdy Bill,
Two cents worth - I've never done multiple stuffing but I have done single replacements.
I have stuffed dry electrolytics inside old wet electrolytic cans. You might try lining the cans with Mylar before inserting the new caps. I drilled a small hole down through the old mounting stud so I could bring out both leads.

I cut the top of the old electrolytic off with jeweler's saw (carefully). Please find attached a
JPG of my effort before assembly. I hope this helps a little.

Hey Roger,

Yep, I can do all that if I could just get the can out of the chassis. One of the mtg screw nuts is hidden up under the bandswitch coils and can't even be seen. I has hoping maybe someone had done this and maybe knew a good way to get to that nut. I will probably just hang some 'lytics under the chassis and I have no problem with doing that. But this can just looked like a good re-stuff project...its square and plenty of room inside. Tnx for your pix too.

Thanks all for your suggestions and comments.

Hi Roger,

The problem is not the rebuilding but getting it out. The cap in question must have been put on the chassis first and then all the band switch assembly added so that you can't get to one of the can mtg. nuts plus the wires are tight in a wiring harness and hidden underneath that assembly. Orig. I was wondering if anyone had been able to get this can out, but the more I look and the more I see its not worth the trouble. I don't have any problem about adding separate 'lytics under the chassis. But that is also sort of a pain as the wires are hard to trace in the hidden wiring harnesses....hi.

In the end, I'm gonna add 'em under the chassis.

Thanks, Bill K4JYS

Niel -

Wow, that is really neat. I have never seen another. The neatest National that I have is an FB7 with a power supply built in, all original, just a deeper cabinet and chassis. Probably one of a kind, either prototype or for a special customer. Your radio however appears to have been marketed, but, like I said, in all my years of collecting, I have yet to see another. I feel you found a very rare and nice piece. I love stuff like that. Congratulations & 73 - Mike

Lou,

Several 20's QST articles and letters refer to absorption modulation. One case is a simple carbon mike connected to a loop around the antenna/output coil absorbing RF (Nov '21) but another is the modulator tube in parallel with the plate supply (July '22) absorbing B+ current, causing the B+ to sag. A third example (Jul 28) has the modulator/absorber tube tapped on the antenna coil.

I'll email you copies for you to take a look at.

Hi Lou,

I believe its proper name was "loop modulation"...

Some years ago, Bob (W2ZM) went on the air near the close of the AWA Sunday afternoon AM net with a loop modulated 201A set-up, as I recall...he was quite readable, too (mind you, Bob is just a few miles across the lake from me).

I don't think there's any particular rocket science about it, Lou: just wind a few turns/loop of wire near the tank coil of the transmitter, and connect a carbon mic element to those turns/loop.

I recall reading that the user of said system must be ever-vigilant against RF burns to the lips whilst modulating, and that the life expectancy of a carbon mic element in such an application was rather short.

There ARE better ways to get on AM, Lou...!

GM/A

I believe its proper name was "loop modulation"... That's it!, LOOP modulation. Thank youuuu, Eddie...

I have taken it upon myself to get the dope on this, to some here, venerated means of stealing time away from The One True Mode for a 'distant' member who recently stole a little REL rig off eBay. The member has yet to announced his find here much to my surprise and disappointment. Are you reading this, Pat?

Due to ancient modifications this rig has many questions. A single loop around the base of the REL plug-in tank former going to (or is it coming from?) a seeming add-on front panel 'phone jack is one of them.

73, Lou G3... sri VE3AWA

Hi Guys,

I've been watching, with casual interest, the goings-on of late on eBay with respect to verner dials/drives...

In particular, there are two Eddystone types available, & already both are half-way to reaching a three figure dollar amount in price...last week an "el-cheapo" Layayette vernier dial earned the unheard of (and IMHO, ridiculous) price of $60.00+!!!

Just who is it that's really buying these things...?

It sure can't be homebrewers: the swell of interest in getting dials exceeds any & all other indicators that the home-construction of multi-stage/multi-tube superheterodyne receivers is a favourite North American pass-time!

Is it speculators...? Collectors...?

Makes you feel sorry for the poor guy on a fixed income, or who might otherwise be cash-challenged, who really & truly does want to build something around a good-quality vernier dial assembly, but can't afford to compete in the acquisition of same...assuming such people still actually exist!

Actually I think there probably are a lot more guys attempting homebrewed stuff than we think. There are dozens of different lists that seem to be full of people putting together regens or crystal radios or transmitters of some description...I'm always surprised when I go looking just how much activity there is, outside of our 'ham' world.

The AWA 2010 CONVENTION was announced at Charlotte N. C. on March 25, 2010. Attendees of the AWA Carolina's Chapter were presented with a Video covering the Rochester Event. That video can be viewed here http://www.youtube.com/watch?v=ex8h-FlIQko&aia=true

The 2010 Event is the longest Radio Convention in a number of years. Featuring a 16,000 square foot Tent, and an expanded flea market along with 2 Auctions, a free party and brand new forums, this event promises to be a real blockbuster. The official web site will be opening in mid April.

Interesting. The Eddystone 898 dial has for many years in this country commanded a high price on Ebay. It is the only slide rule dial I know of made with such precision. They were not
cheap when new many years ago. I think £5.00 was the cheapest I ever saw them, probably more than 40 years ago. the other "cheapo" Eddystone dial is nothing like the same sort of beast and was much cheaper. I notice that the American vernier drives which were so common 50 years ago on the TU5 etc units, are now also fetching very high prices. I recently
enquired about a small vernier dial (new) from Mouser Electronics. They are now nearly £20 here, only a few years ago I bought 6 of them for not much more.
I would make the same comments about PX4 and PX25 valves which are power triodes from 1929 to 1940s or 50s. A pair of them will fetch more than £250 indeed they have been sold for up to £1000 I am told. Who buys them? Are there that many audio nutters around the world? I believe that a lot do go to Japan.

554. 2010 AWA John Rollins Memorial DX Contest -> April 21-22 & 24-25, 2010

Yahoo group: AWAGroup (2010 — 2011)
Date: 2010-03-29 00:02:30 UTC
From: Bruce W1UJR
Topic: 554 Message: 554

The 2nd Annual John Rollins Memorial OT DX Contest will take place in April 2010.

Need A Log or Rule Sheet?
I will be sending out log sheets and rules to those who have regularly participated in previous years events.
Soon you will also be able to download the log sheet and rules directly from the AWA website.
If you have not received contest materials by April 10, you may contact me directly, Bruce J. Howes, W1UJR, 312 Murphys Corner Road, Woolwich, ME 04579, or email to w1ujr@....

Background
If this name sounds new to you, it is because this contest was formally known for a number of years as the “Linc Cundell Memorial Contest”.

The AWA had two events named after Linc, one held in January, and this event held in April.
With the March 2008 passing of long-time AWA member John Rollins, W1FPZ, it was felt that some permanent acknowledgment of John’s many contributions should be made.
John was well known as an exceptionally generous gentleman, giving away advice, parts, and even complete rigs to those interested in participating in the AWA contests.
Some may not know that John was also an avid DXer, a trait left over from his professional life spent largely overseas.
So the suggestion was made, and approved by the AWA board, to rename the DX contest in memory of John.

A change this year is the scoring related to power levels.
This change will allow stations using higher power rigs to participate in the contest, with the goal of making the event open to more station.
Also keep in mind that all AWA contests are now open to non-AWA members. One no longer needs to be an AWA member to participate in, or even to win the contest.
Tim W1GIG has been working with the good folks at the ARRL to get the word out, so be sure to welcome any and all newcomers to the event, be they AWA members or not.
The winner will be graciously asked to send in a photo of their station, in fact, we’d really like to see photos of all stations, so by all means, send along a photo with your log sheet.
We’ll use the best of these in the contest report, and maybe a show and tell at the AWA Conference’s “Amateur Hour”.
As in previous years, we’ll present the winner of the event with a plaque at the AWA Conference in the fall. So encourage your ham friends to join us in the fun!

This contest, held on 40 and 20 meters, gives the West Coast and DX old-time operators a more favorable chance to participate and accords a higher point earning status to the great rigs and circuits of the 1950s and earlier.
In 2009 OT DX Contest participation was down slightly from previous years, so please continue to encourage your fellow ham friends to join in the fun.

These are low-key affairs, with many of us working at 10 WPM. If we hear you signing or calling AWA, you don't need to worry about your speed, everyone will QRS for you. In the event you don't have old time gear, don't let that put you off, the main thing is to join in the fun!

You will notice the 20-meter contest window is only fifteen kilohertz wide again this year. That should make it a little easier for us to find each other on the band. Remember, use old time tuning methods for AWA contests, that is, tune up or down four or five KHz from your calling frequency to get those rockbound operators.

Rules
Dates and Times: Wed. April 21 @ 2300 GMT to Thu. April 22 @ 2300 GMT and Sat. April 24 @ 2300 GMT to Sun. April 25 @ 2300 GMT

Objective: Contact the greatest number of AWA members. When calling, use AWA AWA AWA DE W1UJR as an example.
Once contact is made, exchange RST, name and year of equipment such as TX 35 for a 1935 transmitter and RX 38 for a 1938 receiver. Send MOD for 1960 or later gear.

Rules: A station will be scored only once on each band. Open to all licensed amateur stations. High scorer will be asked to submit photo of station, however photos from all are appreciated.

Frequencies: 7035-7050 kHz and 14050-14065 kHz, +/- QRM.

Scoring: QSO Zones: E eastern zone, U.S. Districts 1, 2, 3, 4, 8, 9 plus VE1, VE2, VE3; W western zone, U.S. Districts 5, 6, 7, 0 plus VE4, VE5, VE6 & VE7; DX zone, all others. QSO Points per contact per zone: E to E or W to W: 1 point; E to W or W to E: 2 points; E, W, or DX to DX: 3 points.

Equipment multipliers: Mod TX and RX: 1 point; OT TX or RX: 2 points; OT TX and RX: 3 points.

Power multipliers (input to final): 0-24.9 watts: 3 points; 25-100 watts: 2 points; 100+ watts: 1 point. (Please note power changes this year)

Determining total points per QSO:
1) Find the QSO points for the contact.
2) QSO points x your equipment multiplier x your power multiplier = total points for the contact.
Scoring examples: N9CQX contacts WU2D
Both are in the E zone for 1 QSO point.
Both have OT TX and RX for a 3-point multiplier.
Both are operating at 10 watts for a 3-point multiplier.
1 point x 3 x 3 = 9 points for each operator.
K6TQ contacts K1FI
W to E contact for 2 QSO points.
K6TQ using an OT TX and RX with 20 watts.
K1FI using an OT TX and MOD RX with 50 watts.
K6TQ's points: 2 x 2 x 3 = 18 points.
K1FI's points: 2 x 2 x 2 = 8 points.

Awards: Plaques will be given out at the AWA Conference in August.

Logs: As stated above, log sheets will be sent out to previous OT contest participants that are identified as such in the membership rolls.
Please send completed logs and computed score to Bruce J. Howes, W1UJR, 312 Murphys Corner Road, Woolwich,

ME 04579, by May 31st, 2010.

Cordially,
Bruce J. Howes W1UJR

Bruce,

Thanks for the nice post to the AWA Group about the upcoming John Rollins event. You said in your post, "Once contact is made, exchange RST, name and year of equipment such as TX 35 for a 1935 transmitter and RX 38 for a 1938 receiver. Send MOD for 1960 or later gear. â?¨

May I suggest that the exchange also include the QTH or at least the State or Province. That would allow folks like me who have a W8 call but are located in the Western part of the US to be properly identified for scoring purposes.

Pat,

The REL 175 seems to be pretty obscure, looking at the QST ads. I checked QST from July 1928 through the end of 1931, and I found the 175 mentioned only once, in the REL ad in September 1930 QST, page 81.

However, judging from other REL ads of the era, and in particular from the full page ads in QST from July 1928, page 71 and November 1928, page 49, REL offered a Shielded, 7 1/2 watt kit that could be built as a single-stage TPTG or a Hartley Oscillator and that used a UX210. I would be very surprised if that's not what originally came in your model 175.

I hope to heary your 175 on the air one of these days. I have a recently-built Hartley using a 10 and an MOPA using a pair of 10s that we could try a QSO with.

Hi James.
Many thanks for info. I wonder if there was a picture of it in the QST, but guess that is too
much to hope for.
Yes it could well have been a kit as some of the construction practices were hardly
'commercial'. For instance there is no bracing for the front panel to the baseboard, it is just
screwed to the edge. The use of exposed terminals on the front panel for the owner to attach
a mA meter for plate current and Amp meter for antenna current, even in those days was a
bit questionable I think, although the panel is engraved for them.
It has been modified to take an English tube which I suspect was an LS5. Maybe it was
bought over here as a kit less the valve and the purchaser decided to use an English Tube so
changed the holder, as there is only vague evidence that a different tube holder was ever
fitted. Also the connections at the back are English screw terminals on an ebonite strip,
whereas I guess over there they would have been Fahnestock clips, which were never liked
in the UK. There is no evidence that Fahnestock clips were ever screwed to the baseboard.
I intend to rebuild/restore it as I got it, not try and guess what it should have been like,
especially as I do not have a 210 tube. Look forward to using it in AWA contests etc. The two
coils I have cover 80, 40 and 20 m but I guess it would be somewhat unstable on 20!!

Pat,

There is a picture in the QST ad, September 1930, page 81. That picture also shows up in Raymond Moore's book, Transmitters, Exciters & Power Amplifiers, 1930 - 1980, page 114. It is pretty fuzzy, and it just shows the front panel, but you would probably recognize it. I will scan it and send it to you.

UX210 "valves" are a little hard to find these days, but 10s or 10Ys are certainly available if you are willing to pay the price. The BC375 world war two transmitter used a 10Y as the speech amplifier, so a lot of them were available after the war. You might also use an 801 which is a lot like the 10 only a bit more hardy and designed for RF service. The 45 is another possibility, a little lower power but still serviceable.

I can only imagine what it will sound like on 20 meters. My 210 Hartley will work on 20, but it has a very interesting note. Perhaps we could try a 20 meter QSO with our rigs one of these days, preferably on a day when the government monitors might not be likely to be listening in, HI.

73,

Jim, W8KGI

581. Lysco History

Topic: 581 Message: 581

I wonder if anyone might know some history of Lysco. I am familiar with the ads in the 1950s QSTs and somewhere there was a review (which I think I have in my file). And according to the name tag on mine, it was made in Hoboken, NJ. I think the ads ran for less than ten years. Anyone know where the name came from (LYS..call suffix? or a guys initials?)...how & who started the company, etc. They came up for discussion in a QSO tonight with a NJ station and am just curious. Thanks..

Does anyone know who the gentleman is with the red sweater and the "Not Exactly" hat? He is sitting on the back of his car, behind his goodies in the 20th photo down. There is also another photo of him earlier that Bengt took. Man, I have not seen Bengt in about 15 years or more. Anders was at AWA the last time I was there with Kathy, and, there is a photo of us in ARC, and our Penske truck full of stuff. There may also be a photo in the OTB. I believe that was in 1999. Regardless, on this fellow's table, there appears to be a radio identical to one I bought a few months ago on ebay. It would be nice to share information about it, as I am convinced in spite of the big bucks I paid for it that it is a more recent reproduction. Alan Douglas does mention the company engraved on it in his 3 volume series.
Thanks & 73 - Mike

Tnx Jim...any bit of info is helpful..I didn't have your info. I have a 600S on the air and a 500 due for a little work. The 600S works well, but a bit drifty. Plus it seems a bit picky about the antenna. I use a Lysco coupler but could only get an end fed inv. L to load on 40 mtrs. I intend to try something longer. I would like to get it on 160 & 80 as well as 40.

Thanks..73, Bill K4JYS

The addition of the W prefix was October 1928 for the USA and +/- about
six months for other countries. I seem to remember that Canada did the
VE assignments a little before the USA.

The RME 4300 is a nice receiver, but just make sure you turn it on and hour before using it for it to stablize. This one does have the vernier which is nice, albeit those need to be lubbed from time-to-time as in all rigs that use that style vernier like the Heathkit SB equipment. Other than that I had one in my bedroom for a few years and enjoyed it a great deal. Did sell it eventually as the bedroom is for sleeping and .... and not radio, hi.

FYI (though not part of the AWAGroup mission) ...

This website also includes a lot of articles from a past UK magazine called "Radio Constructor" that featured lots of transistor and tube radio circuits including many novel reflex topologies. There is a set of Yahoo groups called radioconstructors, radioconstructors2, radioconstructors3, radioconstructors4, radioconstructors5. "5" is the current group and the first four are archives. The original magazine published many innovative articles by Sir Douglas Hall and the Yahoo groups celebrate that as part of their purpose.

The "Radio Constructor" articles frequently specified Denco coils so group members have sought to capture winding information for their recreation.

Larry -

I have totally missed that. Will have to check my back emails. The more I look at the picture, the more I believe I myself recognize the fellow as one of my old friends, Charlie Stinger of Ohio, but, I may be wrong as I have not seen him in about 15 years. Even if it is Charlie, I still would need contact info. Thanks for pointing that out, again, now, see if I can find it, HI. 73 - Mike

Don,

The RME 4300 is a nice receiver, but just make sure you turn it on and hour before using it for it to stablize. Not bad at all, Don. My NC-101X takes 3+ to short of settle down.

The RME 4300 looks tempting and I sure could use an all band rx, but but...well, I'll think about it.

The addition of the W prefix was October 1928 for the USA and +/- about six months for other countries. I seem to remember that Canada did the VE assignments a little before the USA.

You've come thru again, Don, tks.

Hello all,

Marc has notified me that that the Cundall and Kelley results and Rollins Rules are now on line--as is the April "Amateur Radio" column--which has a special link link from the "Events" page.
You can also download the log sheet for the upcoming Rollins contest.

You can find them here -->> http://www.antiquewireless.org/hamevents2010.htm.

I believe that some of the calls may look familiar. :-)

619. Drill Press - Your Thoughts?

Yahoo group: AWAGroup (2010 — 2011)
Date: 2010-04-03 17:20:06 UTC
From: Bruce W1UJR
Topic: 619 Message: 619

I guess its finally time I equipped the workshop with a drill press, and I'm seeking some input.
So much I've seen is Chinese and low quality, not that I want or need to spend megabucks, but I do appreciate and pay for quality.

The use would be in the electronics side of the workshop, I'm not building tables or cabinets, mostly would be drilling panels, wooden or metal chassis, light duty, but requires reliability high precision.

Wondering if anyone has recently bought one of the various small drill presses floating about? Or perhaps you've got an oldie but goodie which is still on the market. If so, would love to hear your feedback.

Thanks!

Cordially,
Bruce J. Howes W1UJR

Jim,

You being the resident expert on NTX-30's what do you thin of the eBay unit. Does it appear to be all original without modifications? Not that I expect to win the bid battle on this rare transmitter, but just interested in your thoughts. I'm to busy (lazy, hi) to go back and re-read your fine ER article on the NTX.

636. 1941 ARRL "How To Become A Radio Amateur" TX Using 6V6 - Kit Build

Yahoo group: AWAGroup (2010 — 2011)
Date: 2010-04-05 01:58:10 UTC
From: w1ujr
Topic: 636 Message: 636

Hi fellows, just enjoying the weekend working on a new radio kit, taken from the 1941 ARRL publication "How To Become A Radio Amateur". Neat little kit, thank Larry for mentioning it to me, uses a single 6V6 tube.

John Dilks K2TQN did a nice write up of the rig in his QST column -->>
http://www.eht.com/oldradio/arrl/2008-01/classic-xmtr-kit.htm

Sold by Pastime Projects, very reasonable price, and lots of fun to build. I'm gradually switching over to the building from the restoration mode, so this is a good first time project. First time I've ever had to drill wood to build a radio TX! Had a ball so far, and really got of kick out of lacing up the cord in proper old buzzard fashion.

Photos in the photo section here, will soon post on my site as well.

Best 73,
Bruce

I followed that one all week. I guess honestly we don't find many NOS R390A's anymore. I'm sure if that was newly built today it would be a $160,000 receiver with all the precision gearing. That nice NOS HRO is still hanging at around $2200, but I'm sure it will climb in the last minutes.

Happily I'm having fun just watching these things sell and not bidding or buying. I was looking for some old manuals for a 1970 vintage single board computer I own and as I searched though all my stuff it didn't take long before I realized I had more than enough projects already at hand to last the rest of my life. So that helps to hamper my desire to buy more stuff. BTW, I finally found my original documents on my good-ol SYM-1 6502 based single board computer from 1977. In a way powering up and playing with an early vintage microprocessor based computer is a lot like powering up an early-30's receiver. Both are very usable, but light years technically from what is currently available.

I noticed the sales slip from Ted Dames with the set. I remember back in 1966, while in college in Indiana, calling Ted to inquire about buying Tektronix scope from him. When he found out I was a college kid, he told me to forget it. 73 - Mike

Bruce,

I'm always impressed by your work benches. They are far to clean and organized, at least when compared to those in my lab. Do you actually complete all your projects in one sitting, hi. I always have ten projects going at once and they are continually moved to one side or the other. Thus my work areas begin to pile up with all sorts of neat little items.

Bruce and Don,

That particular transmitter dates to QST, December 1946, page 33 to 35. The article is "The Most Inexpensive Transmitter, A Complete Crystal Oscillator for $3.95," by Byron Goodman, W1DX. The person who came up with the idea and built the first one was R. O. Deck, Jr. W9JVI. By Goodman wrote it up for QST.

Hi

I'm friends with Lou VE3AWA, he suggested I join this group.

I'm looking for something that will help me on a breadboard rig I put together some time ago. I want to build a modulator for it.

Final is a neutralized 805. I've considered very strongly running Heising modulation and I have enough of a power supply built that could manage this, including the filament supply for the 805.

I'm missing tubes to accomplish Heising modulation at these voltage and power levels however.

I'm near Orangeville Ontario, so I could offer things in trade for any suggestions.

Pat -

I do not know what you mean by "built over here", unless, you mean the UK. The Canadian Marconi Company had a very large presence in Canada. I have numerous pieces in my collection that were pretty common built by them. What makes this unique is the tube line up. My earliest Canadian set using tubes is from the early 20's and uses WE 215A tubes, except that the set I have used Northern Electric 215A tubes, the Canadian version of WE. I will be able to report on it more after I receive it, but, as I said, in the mean time, all ideas are welcome. 73 - Mike

Hello Mike,
Congradulations on winning a fine Marconi receiver! I didn't know it was available on ebay, or I would have bid on it myself! I'm glad to see at last, that it's going to a member of our "Family" here!

Even though the front panel is very different, and the chassis isn't exactly the same (one more tuning condensor, etc) The phyisical layout of the chassis looks very much like the RCA AR-1145 regenerative shortwave receiver of 1929. I'd be very interested in seeing better pictures of the coil layout, etc when you receive it.

This is the closest thing that I can find to your Marconi receiver at the present time. I own a AR-1145 and noticed the simularities between the two. I have some documentation to the aforementioned RCA receiver should you request to see it.

The twin dials are definitely National model "B" I believe, the same as used on the SW-3. Ditto on the National knobs. As you already know; many manufacturers at the time used the national dials since they were the very best obtainable, and incorporated them into their layouts.

The best of luck with your new purchase and I'm looking forward to hearing more about it.

Very Best Regards,
Joe Cro N3IBX

Ah yes. I assume that it is from last years meeting. I did go to it and yes there was interesting
stuff but I bought almost nothing as the price of anything I would have liked tended to be
astronomical. I suppose that to you over there it all looks very different from yours. Just the
same when I look at your meetings - all American!! Most of the stuff is British with a few
European sets, but very little else. I had the impression that not a great deal was actually
sold, certainly there were quite a few 1930s (as well as 1940s, 50s and later)sets that were
really not worth the effort of restoring. Interesting stuff WAS expensive. Very little in the way
of boxes of bits which might yield something useful. Quiet a few valves , 95% post war and all
untested!! I shall go again this year. Friends I spoke to were not over impressed either.

Hello Mike,
You're "correcto-mundo"! The Lafayette "Professional 9" is right up my alley, and looks like it's a pretty good performer as well. it's one I don't own, but would definitely like to!

I'll have to keep a eye on it to see where the price goes, or make a offer as per the description.

Many thanks for the lead!
Joe Cro N3IBX

Joe -

I figured it was something up your alley. I too was tempted to just buy it, but, I really am not that interested in those more sophisticated receivers of the 30's, even if they are rare, and have had my share of them. Besides, where would I put it? The house is already overflowing. I am still looking forward to receiving that Canadian Marconi set, more my style, HI. Regarding the Peak preselector, they would look nice next to each other, but, looks like this receiver already has a tuned front end, mixer and oscillator. Images may not be a problem. 73 - Mike

678. Vintage Cable Lacing - Anybody Have Any To Spare?

Yahoo group: AWAGroup (2010 — 2011)
Date: 2010-04-13 00:57:15 UTC
From: Bruce W1UJR
Topic: 678 Message: 678

Hello all,

Winding up coils for the 6V6 "orange crate" transmitter.
See http://www.w1ujr.net/pastime%206v6%20kit.htm

Can anyone spare or sell me some of the smaller old lacing cord?

Mouser sells only the white or black color, my project uses a light tan or light yellow colored lacing.

Looking for some of the smaller diameter cable lacing cord, ideally yellowish in color.
I can't give you the exact size measurement, about the size of a small string.
Tying up 5-8 wires in bundle.

See photo of size and color at
http://www.w1ujr.net/Bruce's%20Bench%202010/DSC03121%20(1).jpg

Thanks!

Date: 2010-04-13 01:49:58 UTC
From: Bruce W1UJR
Topic: 679 Message: 679

Can anyone help me with the final page of the QST article from December 1946, page 33 to 35, entitled "The Most Inexpensive Transmitter,
A Complete Crystal Oscillator for $3.95," written by Byron Goodman, W1DX?

I have all the pages but the last, which is page 140 according the QST.
On my CDROM copy page 140 does not continue the article, and scanning
that month's issue I can't seem to the find the last page anywhere.
Perhaps this is an error in the scan, so if you have a printed copy,
I would appreciate if you could confirm the error, or send me
that last page.

Thanks!

Garey,

Wow, that was great service, thanks for your efforts!
Now I know what I actually built!

Did you find that in the magazine, or CDROM?
Wonder if my CD has a problem.

Cordially,
Bruce J. Howes

Bruce -

That's from the CD ROM. The error was actually QST's.

The "follow" pages were left out of the December issue. There was an entry in January 1947 in Feedback, saying that indeed the pages were left out, and if you would "trust them one more time" and turn to page 138 of this (January) issue you would find the remainder of the article! :-)

This was kind of a trait of QST back then. If "they" found the error, it would be in next month's Feedback. If "readers" found an error, it appeared three months later, which was the "turnaround" time.

That said, I HAVE found some "lost pages" on the CD ROM. In that same set, I found that the March and April 1946 issues are "switched", i.e., the "March" issue has the March Cover, but the pages are of the April issue, while the "April" issue has the April Cover, but with the March pages!

The early sets were done by "Radio Era Archives" in Texas. The 70's and 80's CDs are barely readable. Starting with the 90's, ARRL took them over, updated the A-View software considerably, and went to PDF high resolution images, probably from the production software.

It is not too early to begin thinking about the AWA 2010 event. The Convention Web Page opens for business on May 7. Pre-registration is strongly suggested.
As the time grows closer, there will be much more about this event.

Lou- Verykewl receiver, IMHO, among the very best!

Any groupmembers own one? Any comments about them and their "Wadley Loop" system?

I don't own one, but would love to someday! The closest thing I have to one is a National FRR-59. Talk about a beast, but I love it!

The bigger it is, and more it weighs, the better it will work - hi!

Joe -

As you know I still have one RA-17 in my shack. Had many of them over the years. It is in one of the photos on my web page. They are great receivers when they are working right, but, sometimes a pain to repair.

BTW, it is ironic that my "good buddy" John Dilks J, in his QST column this month featured the Lafayette receiver I just bought, along with the matching transmitter. He claims he knows of only two in captivity. Now there is a third. 73 - Mike

So, Mike, have you tried out the Lafayette yet (after making the prudent preliminary checks, of course)?

I knew Jim very well and first met him when in my 20's...a real nice guy....he was a dedicated 6m guy and this card is for one of his 6m contacts in 1948. He moved to northern BC many years ago and must now be well into his 80's but as far as I know he is still kicking.

These two coils are, wound in series. The only obvious reason to me is to be able to increase the inductance of the choke, and at the same time also increase the self resonant frequency by minimizing the capacitance between turns. It could have been also accomplished on a single longer wooden dowel, but, they may have had a height constraint. 73 - Mike

GA to the list,

I have a complete set of "RADIO AGE" newsletters produced by Don Patterson until he sold the name, etc. to MAARC.
There are 201 issues between October, 1975 and December, 1993 (his last issue).

I also have the "new" Radio Age published by MAARC starting with the June 1994 issue and complete through all but March and April issues in 1999. A total of 54 issues.

And for those who were members of the long-defunct A.R.C.A. club (merged with AWA), I have most of the ARCA Gazette publications including the last issue before the AWA merger.

Prefer to sell the RADIO AGE as one lot. Same for the ARCA material.

Contact me off-line if there is any interest.

Thanks

73

So Lou,

The choke indeed appears to wired in series but are the two cores wound series-aiding or series opposing. That is to say, are the two cores wound so that their North poles coincide, or are they wound so that when one core's top is North the other core's top is South.

In either case you'd get nearly the same inductance given a little spacing between them but the far field strength would be greatly reduced in the opposing case.

Elaborate - in other words, utter nonsense. If radiation is going to come from someplace there is a lot more of it in other places. Remember, this is an RFC, the further the RF gets down its path the less of it there is. After all, that is why it is there to de-couple RF from DC. We sure do not worry about it now, and, I guarantee you, they did not worry about it then. - 73 - Mike

Subject: RE: [AWA Group] RFC Question

I seriously do not believe any near or far field consideration were thought of at the time for the application of this choke. It was (near field) obviously considered in the design of variometers, but chokes? They just bought components and threw a radio together. Why worry about any radiation? 73 - Mike

Subject: RE: [AWA Group] RFC Question

So Lou,

The choke indeed appears to wired in series but are the two cores wound series-aiding or series opposing. That is to say, are the two cores wound so that their North poles coincide, or are they wound so that when one core's top is North the other core's top is South.

In either case you'd get nearly the same inductance given a little spacing between them but the far field strength would be greatly reduced in the opposing case.

Seems a good start, Coop. Anyone else?

Could they be counterwound to cancel the far field? Sort of like the effect used in humbucking pickups in electric guitars. Just a guess.

I had to check that one out. Interesting set - a one tube regenerative, no doubt, and the coil APPEARS to be a plug-in coil and if so short-wave reception is possible.

The transformer or choke appears non-original.

Hi Guys,

I'm sorry if I've been conspicuous in my absence here lo these past few weeks---last weekend (I think) I missed one of THE biggest premier Hamfests in Canada that's only a 20 minute drive west of me, & I didn't even know it!

The truth is, I've been fightig an uphill battle in our collective efforts to clean-up my 78 year old bachelor brother-in-law's place on 3 acres, since he passed away almost 3 weeks ago now.

Roy was a classic HOARDER, in the strictest sense of the word. As I helped fill the 10 garbage dumpsters we've used thus far (with more to come), and a huge bin taking-in all of the scrap steel in the place (would you believe 5 fridges, 4 stoves, 3 wringer washers, a freezer---and that's just what was inside his house...?!), my thoughts would constantly turn to guys like you & me...

You know to whom I'm referring: the "...collector" who can never quite get his fill, & who somehow never gets around to actually using the stuff he's hoarded so far, er, COLLECTED...(!). This whole experience, whilst far from over, has really & truly forced me to re-examine some of my own habits when it comes to things radio.

Believe me, cleaning-up the "...legacy" of a hoarder is no fun at all: I'm saddened by the sheer waste in expense my brother-in-law endured in "saving" his treasures (it's practically all heading for the landfill site, including the 20 unopened economy-size jars of Kraft peanut butter, 24 unopened jars of Taster's Choice coffee, 40 unopened rolls of aluminum foil & wax paper, ad nauseam).

All I can say is, "Hoarders of the world, repent!" You're denying youself many of life's pleasures in this world through your affliction, & cursing your beneficiaries with a cruel & unusual punishment that they neither want, nor deserve, once you've departed to the hereafter...

My brief stand on the soap box podium...apologies for pontificating so...

Remember the one George Rancourt W1ANX had at NEARFEST a while back? Well, I'd been thinking about passing that one up for a while (it was my style - not a museum piece, and therefore not too expensive), so when I saw George at Radio XLI in Westford last Feb. I made a deal with him. He also told me he had found a cabinet for it, which was lacking when he had it at NEARFEST.

Hi Eddy,

To the landfill? What a waste! You should have saved that stuff for when hyperinflation sets in, or for the next crisis, whenever it comes. Your brother in law was smart, at least in that respect - he just happened to die before it happened. Think of it as insurance.

As far as having stuff that you're never going to use, though; I'm with you there. After I retire later this year I'm going to start cleaning up a bit around the old homestead myself.

I rarely have much energy left or motivation (even for fun stuff) after a full workday, which explains my absence last nite.

This weekend I'll make an effort to get on for a few Q's Saturday evening. WX is supposed to be nice Sunday, so probably won't get on then. Winter is radio season for me.

Yes, I have three of 'em. One in the bedroom to listen to 40 cw in the morning (I know... get a life) one in the work shop as a piece of test equipment and the other in the garage for general monitoring. They are a nice general purpose radio. AM sounds good, USB/LSB/CW reception works great considering they're all $100 hamfest radios. They are NOT very reliable. I have had to put each of them on the work bench over the years for hard component failures and worn out (not dirty) controls, especially the RF attenuator switches. The AGC range is limited and if used with a fair to good antenna the radio will overload, hence the need to use the attenuator switch a lot. I've had no trouble getting parts from Kenwood. 73, /Ed k2mp

Hi Lou,

Funny you should mention that application---James Millen actually sold at one time a nifty little piston trimmer made of ceramic & all, just for the neutralization of final amplifier tubes!

Pretty clever way to do it, I thought to myself, when I first saw one...

Canada Day contest:

Bands and modes: 160, 80, 40, 20, 15, 10, 6, and 2 metres, CW and phone (SSB,FM,AM, etc.) Contacts with stations in Canada or VEOs are worth 10 points. Final score: the totaL QSO from all bands multiplied by the total number of multipliers from all bands.

Sponsored by Radio Amateurs of Canada

Hi Lou & Co.,

This contest is a LOT of fun---a great "ego stroker", too, as the non-Canadian rabid contesters just LOVE to QSO us otherwise lowly Canucks...!

A good opportunity to give your '29 "...works-in-progress" a shake-down run, too, in advance of the real thing in December...and don't worry about pending critiques of the quality of your signal: it's the prefix in your callsign that interests the gang, and not your chirp / buzz / ripple / drift / croak / groan / ...have I left anything out...?! :>)

Hi Lou,

You've got me...!

Best bet is to look at the RAC website, i.e. www.rac.ca & have a look there for the OFFICIAL rules (I'm still busy cleaning-up at my deceased brother-in-law's place).

Lou,

If Roy had been into Ham radio, there is NO DOUBT in my mind but that he would have had AT LEAST two KW-1's stuffed in his cellar, along with a cache of parts that'd sustain Fair Radio for at least one full year...

Alas & alack, he had a fondness, instead, of bicycles (we've tossed out at least 50 so far), and major appliances...

Curiously enough, we found one rather large DeForest-brand entertainment centre in the cellar---a combo BC/SW radio & turntable. It's going off to a local auction...

Go figure.

Eddy

Not only is it not a RX, but it's also probably not made by Bud - it looks homebrew to me. The chassis, however, was surely a Bud product!

VY cool, though. If I didn't already have 2 similar PP RF final decks (only one in use), I just might have bid.

73,
-Larry/NE1S

789. AWA VIDEOS ON YouTube.com

Yahoo group: AWAGroup (2010 — 2011)
Date: 2010-05-07 02:52:47 UTC
From: w3rlw@ymail.com
Topic: 789 Message: 789

Instead of constantly updating all of you on my progress with the AWA videos I just suggest that you keep on checking the AWA Channel. I am in the process of uploading much of the AWA Museum Video Catalog to YouTube. We had discussed making this a member's only premium but felt that "showing our stuff" might be a good way of attracting interest in our organization and hobby.
In the course of editing these features I have found them to be extraordinary especially considering the rather basic equipment originally used. Eventually I will publish a list and place links on our web site. but for now I suggest that you use the link I am providing and check the site every day for new items. We will be posting the newer videos including a brand new Museum Tour with Ed Gable as well as another Ed Gable presentation recently made at a meeting of The Rochester Amateur Radio Association on the History of the Telegraph. The newer videos are made in Hi-Definition and are suitable for group showing.
I need to thank Mike Csontos at the AWA Museum for his work in sorting and initialing digitizing the AWA Slide shows. And of course all of the presenters who created all of this fine work.

Gentlmen,

This morning I telephoned Pat Moore, G3IKR. His wife, Patricia answered telling me that Pat had died in his sleep 2 weeks ago. Pat was, I believe, in his mid-70s.

Though our many early wireless related letters and phone chats I came to know Pat as a very knowledgeable, intelligent, enthusiastic, helpful and, in part, due to his many interests, an interesting fellow to know.

At the wish of Mrs. Moore, please tell others you believe may wish to know.

Live in the moment.
Louis

I think the group is set to pass through attachments but this only works for those receiving individual emails. If you're set for daily digest then the attachments are stripped. I can't remember if we're set for passing attachments or not. There's another group setting for preserving/archiving attachments but I can't remember if that is in effect or not either. You can edit your group membership profile by logging in to Yahoo, going to the AWAGroup webpage and clicking on something like "Edit Membership".

Very sorry to hear this. Talking to Pat on 75M and 20M during the most recent AWA AM QSO party were the high points of the event for me, and I always enjoyed his posts here.

RIP, Pat.

Thank you, Mike.

Reveived from the Eddystone Users Group forum:

Louis

Very sad about Pat.

I and many others attended Pat's funeral, and I can tell you, he had a great send off, very well respected in the Ham and Vintage community

RCA Radiotron UX 210 globe 10 radio audio tube [have a "feeling" tt this will go for a reasonable $. Let me knw if ur gg to bid. I'll cheer u on...]

Dear va3awa,I just checked the tube.. Some was dirt on outside.. There is a mark on the inside of the glass.. My opinion is a result from getter firing.. This is a solid tube and, depending on who you reference, a TV7 minimum value is between 65% and 70% of life.. So, I would expect this tube is at, or over, New rating.. Thanks. Chuck

Hi Lou,

Just can't make myself shell out that much for a tube. But I guess, with inflation over the years, the price might not be too far off from what it would have been back in its day. I'd be mighty skittish about applying fil. voltage to a tube that costly. Sixty-five bux would be cheap compared to a lot I see on eBay. I've got two '10s (ST style) and I'm carefull with 'em..hi.

In her radio show, Dr Laura Schlesinger said that, as an observant Orthodox Jew, homosexuality is an abomination according to Leviticus 18:22, and cannot be condoned under any circumstance. The following response is an open letter to Dr. Laura, penned by a US resident, which was posted on the Internet. It's funny, as well as informative:

Dear Dr. Laura:

Thank you for doing so much to educate people regarding God's Law. I have learned a great deal from your show, and try to share that knowledge with as many people as I can. When someone tries to defend the homosexual lifestyle, for example, I simply remind them that Leviticus 18:22 clearly states it to be an abomination ... End of debate.

I do need some advice from you, however, regarding some other elements of God's Laws and how to follow them.

1. Leviticus 25:44 states that I may possess slaves, both male and female, provided they are purchased from neighboring nations. A friend of mine claims that this applies to Mexicans, but not Canadians. Can you clarify? Why can't I own Canadians?

2. I would like to sell my daughter into slavery, as sanctioned in Exodus 21:7. In this day and age, what do you think would be a fair price for her?

3. I know that I am allowed no contact with a woman while she is in her period of Menstrual uncleanliness - Lev.15: 19-24. The problem is how do I tell? I have tried asking, but most women take offense.

4. When I burn a bull on the altar as a sacrifice, I know it creates a pleasing odor for the Lord - Lev.1:9. The problem is my neighbors. They claim the odor is not pleasing to them. Should I smite them?

5. I have a neighbor who insists on working on the Sabbath. Exodus 35:2 clearly states he should be put to death. Am I morally obligated to kill him myself, or should I ask the police to do it?

6. A friend of mine feels that even though eating shellfish is an abomination, Lev. 11:10, it is a lesser abomination than homosexuality. I don't agree. Can you settle this? Are there 'degrees' of abomination?

7. Lev. 21:20 states that I may not approach the altar of God if I have a defect in my sight. I have to admit that I wear reading glasses. Does my vision have to be 20/20, or is there some wiggle-room here?

8. Most of my male friends get their hair trimmed, including the hair around their temples, even though this is expressly forbidden by Lev. 19:27. How should they die?

9. I know from Lev. 11:6-8 that touching the skin of a dead pig makes me unclean, but may I still play football if I wear gloves?

10. My uncle has a farm. He violates Lev.19:19 by planting two different crops in the same field, as does his wife by wearing garments made of two different kinds of thread (cotton/polyester blend). He also tends to curse and blaspheme a lot. Is it really necessary that we go to all the trouble of getting the whole town together to stone them? Lev.24:10-16. Couldn't we just burn them to death at a private family affair, like we do with people who sleep with their in-laws? (Lev. 20:14)

I know you have studied these things extensively and thus enjoy considerable expertise in such matters, so I'm confident you can help.

Thank you again for reminding us that God's word is eternal and unchanging.

Hi Mike,

You guys south of the 49th couldn't afford to own one of us---too many high maintenace costs, i.e. old age pension, healthcare, employment insurance...and the fact that you'd have to speak to us in BOTH official languages, i.e. French as well as English, on risk of you being hauled before a Human Rights tribunal.

Lou,

You really need to try some of the fine American regional microbrews that have appeared over the past 20 years or so (if you haven't already). It is best enjoyed in the brewpub where it is brewed. A whole different brew than anything available from "Big Beer*" on either side of the border!

*Eaglep*ss: if the shoe fits...

In her radio show, Dr Laura Schlesinger said that, as an observant Orthodox Jew, homosexuality is an abomination according to Leviticus 18:22, and cannot be condoned under any circumstance. The following response is an open letter to Dr. Laura, penned by a US resident, which was posted on the Internet. It's funny, as well as informative:

Dear Dr. Laura:

Thank you for doing so much to educate people regarding God's Law. I have learned a great deal from your show, and try to share that knowledge with as many people as I can. When someone tries to defend the homosexual lifestyle, for example, I simply remind them that Leviticus 18:22 clearly states it to be an abomination ... End of debate.

I do need some advice from you, however, regarding some other elements of God's Laws and how to follow them.

1. Leviticus 25:44 states that I may possess slaves, both male and female, provided they are purchased from neighboring nations. A friend of mine claims that this applies to Mexicans, but not Canadians. Can you clarify? Why can't I own Canadians?

2. I would like to sell my daughter into slavery, as sanctioned in Exodus 21:7. In this day and age, what do you think would be a fair price for her?

3. I know that I am allowed no contact with a woman while she is in her period of Menstrual uncleanliness - Lev.15: 19-24. The problem is how do I tell? I have tried asking, but most women take offense.

4. When I burn a bull on the altar as a sacrifice, I know it creates a pleasing odor for the Lord - Lev.1:9. The problem is my neighbors. They claim the odor is not pleasing to them. Should I smite them?

5. I have a neighbor who insists on working on the Sabbath. Exodus 35:2 clearly states he should be put to death. Am I morally obligated to kill him myself, or should I ask the police to do it?

6. A friend of mine feels that even though eating shellfish is an abomination, Lev. 11:10, it is a lesser abomination than homosexuality. I don't agree. Can you settle this? Are there 'degrees' of abomination?

GM Larry,

I was, of course, commenting on your (and our) Industrial Strength beers. When driving about N. America I look for and buy local for back home enjoyment.

By far though the very best Ale I have ever had is, Tom Paine Ale by Harveys Brewery, Lewes, England. It's avaiable in the US.

73, Lou VE3AWA

Tom Paine 275ml
Brewed to commemorate the bicentenary of Thomas Paine's "The Rights of Man". It is thought that Paine help draft the American Declaration Of Independence. His work still ranks among the best sellers of all time. America celebrates Independence day on July 4th each year. CAMRA has designated July as a celebration of British Independent Brewers of which Harveys is one. Where ever your sympathies lie it is worth raising a glass of Tom Paine. A dry hopped strong pale ale, Tom Paine was awarded the Silver Medal at the BBI Awards in 1993.

It was just my poor attempt at trying to be a Henry Kissinger and obviously I failed. Regardless, the bottom line is, occasional humor of any sort in my opinion is always welcome, and, my post was not the first of its kind. My day started with a phone call from Washington, DC. I then quickly had to call an Army Colonel and then a contractor in Tampa, FL. This was at 06:30. So, maybe it is only me that is in need of some occasional humor and everyone else's life is such that they do not. Yesterday I had to have my 18 year old cat euthanized. Again, regardless, I definitely hate negativity and do try to avoid it. 73 - Mike

It just went to the top of my "must try" list. There's a place called RSVP in Portland that has the most comprehensive stock of imports in the area. I'll give them a call...

Thanks for the tip! Any time, Larry. If they do have it and ur going to the (ham topic>)Convention (<ham topic), pse get 4 extra for me.

73, Lou

Just occurred, Tom Paine Ale / Convention. Beginnings of a Plan?

In her radio show, Dr Laura Schlesinger said that, as an observant Orthodox Jew, homosexuality is an abomination according to Leviticus 18:22, and cannot be condoned under any circumstance. The following response is an open letter to Dr. Laura, penned by a US resident, which was posted on the Internet. It's funny, as well as informative:

Dear Dr. Laura:

Thank you for doing so much to educate people regarding God's Law. I have learned a great deal from your show, and try to share that knowledge with as many people as I can. When someone tries to defend the homosexual lifestyle, for example, I simply remind them that Leviticus 18:22 clearly states it to be an abomination ... End of debate.

I do need some advice from you, however, regarding some other elements of God's Laws and how to follow them.

1. Leviticus 25:44 states that I may possess slaves, both male and female, provided they are purchased from neighboring nations. A friend of mine claims that this applies to Mexicans, but not Canadians. Can you clarify? Why can't I own Canadians?

2. I would like to sell my daughter into slavery, as sanctioned in Exodus 21:7. In this day and age, what do you think would be a fair price for her?

3. I know that I am allowed no contact with a woman while she is in her period of Menstrual uncleanliness - Lev.15: 19-24. The problem is how do I tell? I have tried asking, but most women take offense.

4. When I burn a bull on the altar as a sacrifice, I know it creates a pleasing odor for the Lord - Lev.1:9. The problem is my neighbors. They claim the odor is not pleasing to them. Should I smite them?

5. I have a neighbor who insists on working on the Sabbath. Exodus 35:2 clearly states he should be put to death. Am I morally obligated to kill him myself, or should I ask the police to do it?

6. A friend of mine feels that even though eating shellfish is an abomination, Lev. 11:10, it is a lesser abomination than homosexuality. I don't agree. Can you settle this? Are there 'degrees' of abomination?

7. Lev. 21:20 states that I may not approach the altar of God if I have a defect in my sight. I have to admit that I wear reading glasses. Does my vision have to be 20/20, or is there some wiggle-room here?

8. Most of my male friends get their hair trimmed, including the hair around their temples, even though this is expressly forbidden by Lev. 19:27. How should they die?

9. I know from Lev. 11:6-8 that touching the skin of a dead pig makes me unclean, but may I still play football if I wear gloves?

10. My uncle has a farm. He violates Lev.19:19 by planting two different crops in the same field, as does his wife by wearing garments made of two different kinds of thread (cotton/polyester blend). He also tends to curse and blaspheme a lot. Is it really necessary that we go to all the trouble of getting the whole town together to stone them? Lev.24:10-16. Couldn't we just burn them to death at a private family affair, like we do with people who sleep with their in-laws? (Lev. 20:14)

I know you have studied these things extensively and thus enjoy considerable expertise in such matters, so I'm confident you can help.

Thank you again for reminding us that God's word is eternal and unchanging.

Your adoring fan.

James M. Kauffman, Ed.D. Professor Emeritus, Dept. Of Curriculum, Instruction, and Special Education University of Virginia

(It would be a damn shame if we couldn't own a Canadian :)

Hi Mike!

My reply to your last post was not meant to be contentious. I also am a big advocate of maintaining a sense of humor, and (just for the record!) I personally found nothing offensive in your original post that started this thread, and it was quite clever. Someone with strong religious views might have a different reaction, though, and I respect that too.

Very sorry to hear about your cat. Been there, done that; it's heart-wrenching. Although your old friend can never be replaced, I recommend adopting another one ASAP, both for it's own well-being, and yours.

(Elaine and I plan on arriving at the convention the evening of the 18th for the party under the Big Kahuna, I'll reserve tables for Our Gang. staying all day Thursday and Friday morning, departing around mid-day Friday. After the Ham Ops meeting I hope?)

Louie's Demise Story

A bar fight always makes a good story. This one made a good beer. 1886, Sheboygan, Wisconsin. Louie Eisold, local ladies man, was hit over the head with a full glass of beer and killed. Legend has it, the fracas was over the neighbor's young, stunning wife. Legend also has it, an onlooker pried the beer from Louie's dying hands and toasted his lustful life. We do the same with Louie's Demise Ale, a rich, malty ale full of amber color and complexity. So here's to those who crave an immortal brew with German Perle and Tettnang hops as well as those who appreciate the search for true love.

Word Play

1. Two antennas meet on a roof, fall in love and get married. The ceremony wasn't much, but the reception was excellent.

2. Two hydrogen atoms walk into a bar. One says, "I've lost my electron." The other says, "Are you sure?" The first replies, "Yes, I'm positive..."

3. A jumper cable walks into a bar. The bartender says, "I'll serve you, but don't start anything."

4. A sandwich walks into a bar. The bartender says, "Sorry we don't serve food in here."

5. A dyslexic man walks into a bra.

6. A man walks into a bar with a slab of asphalt under his arm and says:"A beer please, and one for the road."

7. Two cannibals are eating a clown. One says to the other: "Does this taste funny to you?"

8. "Doc, I can't stop singing 'The Green, Green Grass of Home. '" "That sounds like Tom Jones Syndrome." "Is it common?" "It's Not Unusual."

9. Two cows standing next to each other in a field. Daisy says to Dolly, "I was artificially inseminated this morning." "I don't believe you," said Dolly. "It's true, no bull!" exclaimed Daisy.

10. An invisible man marries an invisible woman. The kids were nothing to look at either.

11. Deja Moo: The feeling that you've heard this bull before.

12. A man takes his Rottweiler to the vet and says, "My dog's cross-eyed, is there any thing you can do for him?" "Well," says the vet, "let's have a look at him." So he picks the dog up and examines his eyes. Finally, he says, "I'm going to have to put himdown." "What? Because he's cross-eyed?" "No, because he's really heavy."

13. Apparently, one in five people in the world are Chinese. And there are five people in my family, so it must be one of them. It's either my mom or my dad or maybe my older brother Calvin or my younger brother Ho-Chin. But I'm pretty sure it's Calvin.

14. I went to buy some camouflage trousers the other day but I couldn't find any.

15. I went to the butcher's the other day to bet him 50 bucks that he couldn't reach the meat off the top shelf. He said, "No, the steaks are too high."

16. A man woke up in a hospital after a serious accident. He shouted,"Doctor, doctor, I can't feel my legs!" The doctor replied, "I know you can't - I've cut off your arms!"

17. I went to a seafood disco last week and pulled a mussel.

18. Two Eskimos sitting in a kayak were chilly; but when they lit a fire in the craft, it sank, proving that you can't have your kayak and heat it too.

19. What do you call a fish with no eyes? A fsh.

A very interesting article that appeared in the latest issue of RadioWorld about Ms Lee and the The Brooklyn Children’s Museum. Great reading and pictures of their pre-1920's radio station (2KP).

http://www.radioworld.com/article/100402

I'm glad they put the article on their website too.

Enjoy es 73

Hello Louis, we do ship via USPS First Class Mail if the customer prefers but we will also have to add Registered Mail which will be an additional $11.50 - eBay requires the seller to ship via some form of online tracking.

Louis, VA3AWA,

Not sure of the specifics but in general you can ship domestically via USPS Priority Mail and get a tracking number. Additionally, you can request delivery confirmation (for a little extra). Delivery confirmation on the typical $5-$6USD package costs less than $1USD (again for domestic US shipments). Registered mail is the strictest sense USPS delivery confirmation mechanism surpassing even certified mail.

I don't know how these services extend into the Great White Northern and at what cost.

Of course you're also up against whatever automated means the seller uses for shipping which may not access the full spectrum of available services.

Hi Lou,

I send small flat rate boxes Priority Mail to Canada fairly often. That costs me $11.45 without the delivery signature. You get tracking, but if you want a signature of delivery your probably asking for another $1 added on.

I pretty mush use Priority Mail for all my smaller box shipments since I can do everything online and they pick it up right at my house when doing their normal delivery.

BTW, Canada and all overseas Priority Mail shipments made a big jump in price a couple of years back. Some of that got offset a little when they started offering the flat rate boxes. Thankfully most of my shipments use the smallest flat rate boxes.

If your buying or selling something on eBay, and PayPal is used, I can see why they might require the tracking. I had two bad eBay purchases last year and both of them got rectified. PayPal refunded my money. The tracking was instrumental in both cases.

It is interesting to see the tube tester the guy used to test the 213. It is an extremely rare WWII German tester made by Telefunken. It uses cards with plugs that you insert into the tester where the holes are in the card for a given tube. Looks like his tester was modified to test some US tubes as well. I always wanted one of those testers and of course, now I have two of them J. 73 - Mike

Well, there is a reason for everything. The first one I got was from a local estate, and, the previous owner hacked up the cover. The cover, has about 20 additional very unusual German tube sockets mounted to it and connects to the main tester via a plug in cord. I got that about 15 years ago. About 10 years ago there was one on eBay that had the cover, and a bunch of additional cards, so I got that one as well, in order to have a complete unit. 73 - Mike

World War 2 Military Aircraft B-17 B-24 Bomber Egg NEW WT-7-A

http://cgi.ebay.com/World-War-2-Military-Aircraft-B-17-B-24-Bomber-Egg-NEW-/270582085147?cmd=ViewItem&pt=LH_DefaultDomain_0&hash=item3efff2f61b

WT-7-A

Here is a neat bit of World War 2 technology.

Most people think that B-17 and B-24 bombers were made by Rosie the Rivetter in large factories run by Boeing, Consolidated, and so forth. This is not true. They were actually hatched from eggs, like any other flying thing. Offered today is one of the bomber eggs, unhatched and new in the box. Inside this thick metal teardrop is a tiny bomber waiting to hatch and fly, but for some reason, 65 years have passed and nothing has emerged.

This was super secret technology, folks. So secret, in fact, that the military came up with a very convincing story to cover the bomber hatchery program. They called the eggs "WT-7-A Antenna Weights", made for the Signal Corps for use with the BC-375 aircraft radio. The military also went so far as to mock up most every B-17 and B-24 with one of these WT-7-As, along with the associated trailing wire, fairlead, and antenna wire real. They even spooled out the wire in flight, with the eggs tied to the end of the trailling wire, many feet away from the aircrafts' tail. This spoof was indeed convincing - even the Germans thought they were indeed just antenna weights - but it also had an unseen benefit. Towing the unhatched eggs in flight, during real wartime missions, yielded better bombers. Some have equated this to the theory that human infants exposed to Bach and Strauss in the nursery during the first year of life become musically inclined. We may never know for sure - official documents concerning the bomber hatchery program were highly classified, and have been destroyed.

Anyway, offered is one unhatched egg (sorry, because of its age, it may never hatch properly), cleverly disguised as a Signal Corps WT-7-A Antenna Weight for the BC-375 transmitter. The egg weighs about 3 pounds, and is about six inches in length, not counting the cable.

Signed, Seller

Angela Noseworthy of the Admiralty House Museum, Mount Pearl, Newfoundland has an unidentified radio. She wondered if it could be a National and how old it might be.

Below is her note to me. Photos may be found at
http://www.prismnet.com/~nielw/AdmiraltyHouseMuseum/

I've already given her my ideas based on the NCCo "logo" and the single tipped RCA tube but I wondered what the rest of you thought. Could it be a National and, if not, what? and about how old is it?

73,
Niel - W0VLZ

****

Hello,

I work at an early communciations museum in Newfoundland Canada and am looking for information on a receiver I believe is National Radio Company make. I came across your site online and I'm hoping you might be able to confirm this and possibly give me an estimated date of manufacture.

It's a very old machine - most closely resembling the 1-10 on your site. There are no serial numbers on the machine - just a diamond pattern in the top as well as NC CO on one of the knobs. There is an RCA tube inside. I have attached photos to illustrate.

Any information would be greatly appreciated,

Angela Noseworthy - VO1ANG

I think so, Steve. All web publications refers to the 1930-1934 ARRL HandBooks, some - to first edition of Jones "How To Become Radio Amateur", but I have only 1936th Handbook and 4th Jones edition.

If you have this article, plese, place it somewhere in the net for download or send me via e-mail. I'm playing with T.N.T. based design and that article is capitally needful for me right now.

I don't think these were published in the Jone's Handbooks but I may be wrong....perhaps these Handbooks were published after the TNT became unpopular.

I will try and send the original article to your 'ur3' e-mail address later this morning.

Sure, I can't found any TNT in the Jones Handbooks, nor in his "Newcomer" and "How to become..", but as I heard, there was one publication in the first edition of "How to..". As I heard, I say, it's just a rumor :)

Andy, The original was in the Dec 1929 QST..."A Single Control Transmitter" or some similar title. I think its also in the early '30s ARRL handbooks (its in one of mine, dated 1932). I built one and it worked great. You may be able to get someone to scan it for you.

Good luck,

Thank you for pointing, I have to dig the net a little. I have QST files from 1923 up to 1925 and several 1916, but that's all.

Andy,

I doubt it is the original TNT article, but the transmitter in the 1930
edition of ARRL's "How to Become a Radio Amateur," is, indeed, a TNT.
They just don't refer to it as such. Uses a single '10.

After acquiring several Lysco Transmasters, over the last few years, I have often wondered where the name came from. Also, I haven't been able to find out much about the company history. I recently received a copy of a Lysco catalog, dated Jan 1951. After looking over it a few times, nothing much really popped out at me. However, a few days ago I happened to look at it again. The front cover has sketches of an airplane, boat, car and a radio tower/shack, depicting the possible uses of Lysco equipment. In fine print, on each of the sketches, were call letters. They were as follows and the 1959 call book yielded: W2ANW - LYdon; W2NEL - Schmidt; W2DRA - Scott & W2JJR - Lawrence. All were located in Rutherford, NJ. Looks like a good bet that 'Lysco' probably came from their last names. I've been wondering about that for a good while....ain't trivia interesting?

The only thing I know is they had a plant in Hoboken, NJ and East Rutherford, NJ. Can anyone add anymore about these guys and/or Lysco?

916. RME-69 project (somewhat long)

Yahoo group: AWAGroup (2010 — 2011)
Date: 2010-07-14 16:40:50 UTC
From: Larry Szendrei
Topic: 916 Message: 916

All,

Just wanted to post about what's on my bench presently.

This spring at the Deerfield hamfest I purchased an RME-69 "project" unit from George Rancourt, K1ANX, through a pre-arranged deal. It was very rough cosmetically, and someone had done a real hack job with wholesale capacitor and resistor replacement; that was a real mess. There were even several unsoldered wires, and B+ was shorted to ground due to a wiring error. George was parting with it because this was a project he concluded he'd probably never get to. All the important stuff was present though, and the RF coil and bandswitch wiring were, at least, unmolested.

The RME-69 is a mid-1930s design, using pre-octals. There was a noise-limiter upgrade on a sub-chassis which plugged in to the two 6D6 IF amplifier tube sockets, and to make everthing fit this module uses octals. (6K7 1st IF, 6L7 noise-controlled 2nd IF, 6J7 limiting amp, 6H6 noise detector). My example came with this unit.

Due to summertime projects and other demands on my time, I haven't had a lot of time to work on this until this past weekend, and have been picking away at it here and there until then. I'd ripped out pretty much all the underchassis wiring (except for the RF coil/bandswitch assembly) because it was just beyond hope. I also didn't even try to power up the set before proceeding with this, for obvious reasons. My friend Bruce W1UJR was kind enough to lend me his RME-69 so that I could reproduce the original component placement and lead dress as I completed the rewiring job.

Anyway, last weekend we had some rain, so I had a chance to spend some quality time with this project. I completed the underchassis re-wiring, and fired the set up with a pair of 6D6s in the IF sockets as originally designed. Once I aligned the IF circuits to the XTAL frequency I started hearing signals. The brodacast band was way off calibration so I took care of that. I have not done any further alignment of the frontend yet, but even so, man, what a hot receiver! Even at 30MHz, I can tell just by peaking the antenna trimmer on band noise that its sensitivity is better than most other similar sets of the era that I've played with. All bands except band 2 (see below) produced signals, but fewer and weaker on band 6 (the highest frequency band) due to the MUF.

I then replaced the IF tubes with the noise limiter module. An intermitant short from the 1st IF plate to ground in that module took out the B+ decoupling resistor but the 2nd IF primary seems no worse for the wear (dodged that bullet, whew!). Fixed the short and replaced the smoked 2K resistor, then had to re-align the IF back to the XTAL frequency due to different parasitic capacitances in the octals and wiring. Other than now

having a working noise limiter, the receiver now functions just as it did with the 6D6s in the sockets.

Band 2 was initially dead but that turned out to be a trimmer cap shorting to ground. Troubleshot and repaired that last night. Still to do is to pad the BFO onto the IF frequency (it's too high by about 10 KHz), rewire the XTAL filter back to original, complete alignment of the frontend, and cosmetic restoration of the front pannel, including replacing the dial glass which is broken. The best part of this is there's no panel lettering to worry about!

73,
-Larry/NE1S

All,

Just wanted to post about what's on my bench presently.

This spring at the Deerfield hamfest I purchased an RME-69 "project" unit from George Rancourt, K1ANX, through a pre-arranged deal. It was very rough cosmetically, and someone had done a real hack job with wholesale capacitor and resistor replacement; that was a real mess. There were even several unsoldered wires, and B+ was shorted to ground due to a wiring error. George was parting with it because this was a project he concluded he'd probably never get to. All the important stuff was present though, and the RF coil and bandswitch wiring were, at least, unmolested.

The RME-69 is a mid-1930s design, using pre-octals. There was a noise-limiter upgrade on a sub-chassis which plugged in to the two 6D6 IF amplifier tube sockets, and to make everthing fit this module uses octals. (6K7 1st IF, 6L7 noise-controlled 2nd IF, 6J7 limiting amp, 6H6 noise detector). My example came with this unit.

Due to summertime projects and other demands on my time, I haven't had a lot of time to work on this until this past weekend, and have been picking away at it here and there until then. I'd ripped out pretty much all the underchassis wiring (except for the RF coil/bandswitch assembly) because it was just beyond hope. I also didn't even try to power up the set before proceeding with this, for obvious reasons. My friend Bruce W1UJR was kind enough to lend me his RME-69 so that I could reproduce the original component placement and lead dress as I completed the rewiring job.

Anyway, last weekend we had some rain, so I had a chance to spend some quality time with this project. I completed the underchassis re-wiring, and fired the set up with a pair of 6D6s in the IF sockets as originally designed. Once I aligned the IF circuits to the XTAL frequency I started hearing signals. The brodacast band was way off calibration so I took care of that. I have not done any further alignment of the frontend yet, but even so, man, what a hot receiver! Even at 30MHz, I can tell just by

peaking the antenna trimmer on band noise that its sensitivity is better than most other similar sets of the era that I've played with. All bands except band 2 (see below) produced signals, but fewer and weaker on band 6 (the highest frequency band) due to the MUF.

I then replaced the IF tubes with the noise limiter module. An intermitant short from the 1st IF plate to ground in that module took out the B+ decoupling resistor but the 2nd IF primary seems no worse for the wear (dodged that bullet, whew!). Fixed the short and replaced the smoked 2K resistor, then had to re-align the IF back to the XTAL frequency due to different parasitic capacitances in the octals and wiring. Other than now having a working noise limiter, the receiver now functions just as it did with the 6D6s in the sockets.

Band 2 was initially dead but that turned out to be a trimmer cap shorting to ground. Troubleshot and repaired that last night. Still to do is to pad the BFO onto the IF frequency (it's too high by about 10 KHz), rewire the XTAL filter back to original, complete alignment of the frontend, and cosmetic restoration of the front pannel, including replacing the dial glass which is broken. The best part of this is there's no panel lettering to worry about!

73,
-Larry/NE1S

TNX OM. Having your set handy as a reference was a great help. Even in troubleshooting the band 2 issue, resistance comparisons between the 2 sets lead me to the shorted trimmer much faster than otherwise (1.1 ohms osc. grid to ground on yous vs. 0.2 ohms on mine).

Hi Guys,

A friend & former clubmate---Bob, VE3SRD---advised me to-day of a freebie that's simply too good to pass up for nearby Canadian AM aficianados...

It's a beautifully-made, all homebrew transmitting ensemble, carefully crafted years ago by now-SK Ted (VE3AVC). Here's what's includd:

-A HB DX-100 clone AM/CW transmitter;

-A homebrew 813 amplifier & p.s.;

-At least TWO HB VFOs, and last but not least,

-Ted's "Black Rack"---a HB QRO AM transmitter, consisting of a p.s., modulator, p.a., tuner, & VFO.

Unfortunately there is little, to no, documentation that comes with these creations---but they're all expertly made, and FREE to a good home, if the Ham in said home can put any or all to good use.

Please contact Bob (VE3SRD) directly to arrange for pick-up, whatever, at VE3SRD@...

Thanks, guys---and feel free to tell any of your buddies who might be interested...a nice way to get one's feet wet in the AM mode, for sure!

923. Fw: Contest Suggestions

Yahoo group: AWAGroup (2010 — 2011)
Date: 2010-07-17 02:04:41 UTC
From: JAMES HANLON
Topic: 923 Message: 923

The following is a message that I sent to Tim Walker, W1GIG, in response to his request for suggestions for the AWA contests. I thought I would share it with this group as well in the hope that it may generate some additional comments and suggestions that would be useful. Please copy any good ideas to Tim at W1GIG@...<mailto:W1GIG@...> .

Jim Hanlon, W8KGI

Tim,

In the current issue of the AWA Journal, you invited suggestions on how to improve our AWA On The Air events. I won't be able to attend the upcoming Convention, so I will make some suggestions via this email.

First off, I'm Jim Hanlon, W8KGI, and I am a regular participant in all of the AWA events from out here in New Mexico. Honestly, I must report that from my vantage point, participating in any of the AWA events is difficult and not much fun because of the very few number of stations that I can hear. I spend hours listening and calling with little result.

In contrast, I also work the Classic Exchange (see http://qsl.asti.com/CX/<about:blank>) which in many ways is similar to our Linc Cundall Memorial CW Contest, and I have a grand time. Let me compare my experiences in the Linc Cundall contest and the Classic Exchange, both in January, 2010, to show you the difference between the two.

On the Linc Cundall event, I worked three stations on 80 meters, KB0ROB in MN, VE7SL in BC, and W04S in VA in a period of three and a half hours on 1/23. I worked three stations on 40 meters, W0LGU in MN, KB0ROB in MN, and AA9DH in IL in a period of three and a half hours on 1/24.

The Classic Exchange ran on 1/31. On 20 meters I made 35 QSO's with 9 different stations in OH(3), NM, IL, PA, CA, IN, and MI in a period of four hours. On 40 meters I made 37 QSO's with 18 different stations in TX, OH(3), CA(3), NE, CO, ND, MO, NY(2), OR, MI, ID, and PA(2) in a period of three and a half hours. On 80 meters I made 34 QSO's with 16 different stations in AZ, GA(2), ID, NC, OH(2), PA, WA, CA(2), OR, MO, NJ, CO, and WI in a period of four hours.

As you can see, the Classic Exchange has a lot more activity and is therefore a lot more fun. I think we can learn a few things from the way that the Classic Exchange is run that will improve the AWA events.

First off, the Classic Exchange is well publicized. Howie Holden, WB2AWQ (WB2AWQ@...<about:blank>), takes care of placing notices in multiple places. I know that they show up in QST and in Electric Radio, and I'm sure in many other places as well. I suggest that you contact Howie and see where he places the notices for the Classic Exchange. Since we are now inviting non-AWA members to participate in our contests, a very good idea by the way, it would pay to spread the word among the general amateur population about the AWA events as widely as possible.

The Classic Exchange allows multiple contacts between the same stations on the same band if at least one of those stations uses different sets of equipment. That encourages guys to get more, "classic" equipment restored and on the air, and it increases the activity in the contest as well. We desperately need more activity, so allowing our participants to switch to another transmitter/receiver pair and make additional contacts with the same stations would be a very good idea. I, myself, have two shacks, one with 12 receivers and 12 transmitters and the other with 12 receivers and 28 transmitters. I never get them all on the air for the same contest, but I still am able to use quite a few of them and I generate quite a bit of activity because I am able to work with so many different pairs.

The Classic Exchange suggests a single, center frequency on each of the bands. On 80 that is 3545, on 40 7045, and on 20 14045. Stations spread out around those frequencies when activity is heavy. The advantage of having a single, center frequency rather than a 20 kHz band is that, when activity is light, an operator can just tune a receiver to that one spot and use a broad selectivity setting and he will be able to hear any station that comes on the air. He may be off doing something else, perhaps making a repair on a piece of gear that has broken down on an adjacent workbench. But he is always able to hear when a contest station has come on the air and he can walk over to his own rig and reply. If he has a 20 kHz wide band to search, he can't do this. In a contest where participation is sparse, he will miss many opportunities to make contacts if the stations are not concentrated within a narrow bandwidth. So, the moral is, Concentrate AWA activity around a single frequency on each band.

Finally, the power scoring rule for the Linc Cundall and Bruce Kelley contests encourages anemic signals. That may work well enough when the distances between stations are not great, and if you look at the locations of the stations participating in these two events you will see that they are concentrated along the eastern seaboard and in the north central US. But if you want a geographically diverse group, such as there is in the Classic Exchange, you need to encourage people to put the best signals on the air that their equipment is capable of. So my final suggestion is that you eliminate the scoring multiplier for running lower power in the Linc Cundall event and the power limitations of 10 and 20 watts input for the Bruce Kelley event.

The Classic Exchange also runs an AM/SSB/FM phone event on a separate day from the CW event reported above. It is not as popular as the CW event, but I made 22 AM QSO's and 4 SSB QSO's in two and three-quarter hours when it ran on 2/14. In contrast I made 8 AM QSO's in four hours on the AWA AM QSO Party on 2/21. The same suggestions above about better publicity, multiple contacts with different equipment, and a single, center frequency would help out the AM QSO Party as well. I would also suggest that you expand the number of Flagship stations from two to at least three. Having a "Western" flagship station in Minnesota, not even half way across the country, is a little lame. You should keep the flagship stations in New York (eastern) and Minnesota (north-central) and add flagship stations in the Southeast and the true West. That would encourage and facilitate participation across the country.

I hope these suggestions will at least generate some conversation at the Convention's Amateur Hour. Please let me know, Tim, how they were received.

73,

Jim Hanlon, W8KGI

Jim,
Amen!! In the last test I spent many hours and well over 100 CQ AWA transmissions for a grand total of 4 QSOs. This is disconcerting to say the least. I wound up with more non-AWA QSOs. I realize that amongst the general ham population we represent a miniscule number. I like your ideas.

927. F/S National SW-5 receiver with 5880 Velvet AB Power Supply

Yahoo group: AWAGroup (2010 — 2011)
Date: 2010-07-18 18:05:22 UTC
From: Charlie
Topic: 927 Message: 927

Friends,

Offered for sale is a National SW-5 "Thrill Box" with the "Green" coil pair 2.5 to 4.5 Mhz. and the National 5880 Velvet AB power supply.

The receiver is complete with tubes. It has original, soiled, brown wrinkle paint on the receiver, with minor chassis rust, power supply finish is good. The radio has also been tried with the "10" series and the "60" series Amateur Bandspread coils and performs very well.

There is NO guarantee as to operation, as with all old electronics, shipment may cause defects.

Images of the National SW-5 "Thrill Box" with the "Green" coil pair 2.5 to 4.5 Mhz. and the National 5880 Velvet AB power supply.

http://home.comcast.net/~valkyre7/MVC-220FG.JPG (Front)
http://home.comcast.net/~valkyre7/MVC-221FG.JPG (Inside top)

http://home.comcast.net/~valkyre7/MVC-223FG.JPG (Rear)
http://home.comcast.net/~valkyre7/MVC-224FG.JPG (Inside Bottom)

As described and shown above, $435, Post Paid, CONUS, with delivery confirmation and insurance.

Pick-up is possible if you are local.

Sent Post Paid, CONUS only, with Delivery Confirmation and insurance.

Terms and Conditions:

- Sold as is, as shown, No guarantee as to operation.

- Remit in order of preference: CASH, USPS money order only or personal check, please.

- NO PayPal, NO other type of money order, NO cashiers or bank checks.

- Respond via email to address in header

For more details about the National SW-5 see:

http://www.w1ujr.net/national_sw-5.htm

How the coils are configured see:

http://www.io.com/~nielw/sw3coils.htm

Best,

Charlie

Mike,

I actually have a Collins 32RA8 on the air, and you are quite right, it is a heavy beastie. Mine was a gift from a friend here in New Mexico. It is so heavy I put it on a little dolly when it arrived and it is still there. I can turn it up to work on the underside when necessary, but I sure can't lift it onto my workbench.

But pre-war transmitters are pretty scarce, so I thought someone here might be interested.

73,

Jim, W8KGI

Hi Guys,

Well, I certainly hope you proverbial "...window shoppers & tire kickers" out there will make your move for this classic HB gear---and do it FAST...!!!

OM Bob tells me he's had SIX inquiries about it already---"YOU SNOOZE, YOU LOSE"...!!! Get off your collective butts all you arm-chair AM'ers, & actually USE some of this vintage stuff...! Where you gonna find a better deal than this...?!!!

Gentlemen,
May I commend to you an article in the most recent number (254) of Electric Radio, pg. 42. It is a treatment for restoring Yellow Plastic Parts. I have not tried it yet but seems reasonable.

Hi Guys,

Far be it for me to try & derive any pecuniary advantages through this group, but we're almost finished cleaning-out the last of the brother-in-law's stuff (he passed-away 3rd April), & one of the last remaining items is a 1948(?) DeForest entertainment centre...

NOBODY locally seems to be the least bit interested in it---if nothing happens, I'll simply part it out & give the cabinet to a wood-working friend of mine...

I absolutely hate to do this, but have no choice---so, if anyone out there reading this is at all interested, please speak now or I'll forever have the DeForest in pieces...! Literally.

It may be seen at:

http://toronto.en.craigslist.ca/drh/atq/1836810435.html

The price is negotiable...

From: Joseph
Topic: 935 Message: 935

Hello All,
Would anyone have a manual, schematic, or copy thereof to a "Peak" model P11 pre-selector?
it was made by the Eastern Radio Speciality Co. of NYC around 1935.
It was used to provide a TRF coupled RF stage in front of receivers of the day.

if you have the original manual, or the schematic for one I'd greatly appreciate a copy thereof and am willing to swap, pay, whatever for it.

I'm also interested in schematics for other "Peak" products. I have a elabprate 5 tube preselector that uses plug in coils. The model number is unknown at this time.

Thanks for the bandwidth!
Joe Cro N3IBX

Joe -

If it is similar to the one I have with the plug-in drawer coils, I may have a schematic someplace downstairs. I am thinking it is inside the unit. I'll check. 73 - Mike

Just found at http://members.cox.net/n7rk/howard.htm ftp link to 460's schematics ftp://bama.sbc.edu/downloads/howard/460/

It should be a good idea to ask David N7RK about this RX.

Hi Joe,

This is your lucky day. I bought a Peak P11 and Peak Aural Radiotelephony Monitor at the AWA Conference Fleamarket back in 2007. These were from the estate of Herb Ross W2QZ who I think ran Peak and he also wrote all the articles on the Peak products in the early 1930's magazines. So I was fortunate to also get all his documents with these two units that look like they were used for a presentation (probably at the AWA). I even have original professional photo of the various products that were used in the magazine ads and articles. I put together a nice little document on the Peak P11 that includes copies of original sales pages, the two page manual and a couple of detailed magazine articles on the P11. The schematic appears a few times in this document set.

I wanted to load it up to our AWA Group Yahoo area, but they restrict file size to 5MB. This file is a 15MB (nice grayscale scan) so I was forced to add it to my "Vintage Documents" area on my website <www.radiolabworks.com> www.radiolabworks.com. You can view and download it from there.

Enjoy the P11. I have as yet done nothing with mine, but it is a keeper.

Don -

Very interesting. I have two preselectors that look almost identical from the front to the P-11, however, they use plug in drawer coils for different bands. When I used to be active in the AWA contest, I used it with my FB-7. It made 160 meters usable, and improved 80 considerably.

Also interesting to see another FPM-200. I have had several, and still do, but one is very damaged. I sold one some years back when I needed money after my divorce, but, still have the one that used to belong to Gen. Curtis LeMay. I also have the provenance papers to prove it. It is the first one Bill Halligan made, after LeMay bitched at him for not having a similar rig as to what Art had at the time. It was a gift to LeMay. I have the original blue-print of the schematic, with red-lines, supposedly made by Art. 73 - Mike

Hi Mike,

As far as my documents go the P11 looks to be the only preselector/amplifier they made at the time (1934'ish), but perhaps they had a few more products later on. Abeit all the Eastern Radio Specialty Company products in my file shows nothing else. An FYI, Ross W2QZ is the gent sitting in the chair with his hands on the Patterson receiver on page 5 (the Short Wave Radio article). My main reason for buying these Peak items was the extensive and rare documents that were included and second that I too felt it would be a good front end for my FBXA receiver. Both the units I bought are in super nice condition as well.

Relating to the FPM-200. Well that was here for less than a year. It was my duty to get it into shape and sell it for Dick Schnell who is the son of the famous Fred Schnell 1MO (details on it's history appear on that section of my website). That FPM-200 was also a gift to Fred from Bill Halligan. They were good friends in both Chicago and later when they both lived in Florida. That FPM-200 was actually used mobile by Fred for awhile. I like the performance of the rig and worked several stations including some DX during my time with it. Like the old tube commercial VHF FM transceivers having that whine from the vibrator supply was always irritating during transmit. I guess for the same reason I've never had much interest in the military dynamotor stuff either, hi. Mr. Halligan was way to late, or maybe early, as the much cheaper stuff was starting to appear. Heck even a Collins S-line was less costly at the time the FPM-200 was produced. I was told that some college in Illinois got all the remaining FPM-200 parts long ago. Don't know how much of that is the truth though.

Just a FYI, in case anyone is counting, I also have a Peak P11 in my collection. Appears as new condition with bright shiny black panel. Works good, but those big claims for great performance include internally generated noise. Probably an early example of the life long quest for improved signal to noise ratios - hihi. The AWA museum collection has no P11.

Warm regards,

Ed Gable K2MP
Curator Emeritus, AWA Museum

Hi,
     I might offer up the fact that Sargent also made a preselector in the same time period.
I have no info on it and except for a couple of ads in old "RADIO" magazines I have heard little about it. I have a hand drawn schematic that I made but it is missing several caps (?). I have been on a quest for years to get data or a schematic for this item. It was specifically made for 10 and 20 meters, where images would be a huge problem for the RX of the day. If there is anyone out there with anything on the Sargent, I would like to beg, borrow, steal or buy it. :) :)

     Luckily my FBXA comes with a PSK preselector.

Just a FYI, in case anyone is counting, I also have a Peak P11 in my collection. Appears as new condition with bright shiny black panel. Works good, but those big claims for great performance include internally generated noise. Probably an early example of the life long quest for improved signal to noise ratios - hihi. The AWA museum collection has no P11.

Warm regards,

Ed Gable K2MP

Hi Mike,

As far as my documents go the P11 looks to be the only preselector/amplifier they made at the time (1934'ish), but perhaps they had a few more products later on. Abeit all the Eastern Radio Specialty Company products in my file shows nothing else. An FYI, Ross W2QZ is the gent sitting in the chair with his hands on the Patterson receiver on page 5 (the Short Wave Radio article). My main reason for buying these Peak items was the extensive and rare documents that were included and second that I too felt it would be a good front end for my FBXA receiver. Both the units I bought are in super nice condition as well.

Relating to the FPM-200. Well that was here for less than a year. It was my duty to get it into shape and sell it for Dick Schnell who is the son of the famous Fred Schnell 1MO (details on it's history appear on that section of my website). That FPM-200 was also a gift to Fred from Bill Halligan. They were good friends in both Chicago and later when they both lived in Florida. That FPM-200 was actually used mobile by Fred for awhile. I like the performance of the rig and worked several stations including some DX during my time with it. Like the old tube commercial VHF FM transceivers having that whine from the vibrator supply was always irritating during transmit. I guess for the same reason I've never had much interest in the military dynamotor stuff either, hi. Mr. Halligan was way to late, or maybe early, as the much cheaper stuff was starting to appear. Heck even a Collins S-line was less costly at the time the FPM-200 was
produced. I was told that some college in Illinois got all the remaining FPM-200 parts long ago. Don't know how much of that is the truth though.

On 7/28/2010 2:50 PM, Mike Feher wrote:

Don –

Very interesting. I have two preselectors that look almost identical from the front to the P-11, however, they use plug in drawer coils for different bands. When I used to be active in the AWA contest, I used it with my FB-7. It made 160 meters usable, and improved 80 considerably.

Also interesting to see another FPM-200. I have had several, and still do, but one is very damaged. I sold one some years back when I needed money after my divorce, but, still have the one that used to belong to Gen. Curtis LeMay. I also have the provenance papers to prove it. It is the first one Bill Halligan made, after LeMay bitched at him for not having a similar rig as to what Art had at the time. It was a gift to LeMay. I have the original blue-print of the schematic, with red-lines, supposedly made by Art. 73 – Mike

Subject: Re: [AWA Group] Peak P-11 preselector info wanted:

Hi Joe,

This is your lucky day. I bought a Peak P11 and Peak Aural Radiotelephony Monitor at the AWA Conference Fleamarket back in 2007. These were from the estate of Herb Ross W2QZ who I think ran Peak and he also wrote all the articles on the Peak products in the early 1930's magazines. So I was fortunate to also get all his documents with these two units that look like they were used for a presentation (probably at the AWA). I even have original professional photo of the various products that were used in the magazine ads and

articles. I put together a nice little document on the Peak P11 that includes copies of original sales pages, the two page manual and a couple of detailed magazine articles on the P11. The schematic appears a few times in this document set.

I wanted to load it up to our AWA Group Yahoo area, but they restrict file size to 5MB. This file is a 15MB (nice grayscale scan) so I was forced to add it to my "Vintage Documents" area on my website www.radiolabworks. com. You can view and download it from there.

Enjoy the P11. I have as yet done nothing with mine, but it is a keeper.

It must be about 100 days now and counting down to the BK 1929 QSO Party. Any new rigs planned?

I've gotten email from Terry, KE5YUM, in Ada, OK. He's in the process of studying the literature and gathering parts to build a Hartley with the goal of getting it on the air by December. He's using Scott's design from the AWA journal.

My biggest need is a better 80 mtr antenna...but I may have to change QTH before that happens.

Hi Niel,

I've always wanted to incorporate one of the several 861 tetrodes that I have here into some kind of a MOPA design here, but have been far too pre-occupied with the estate & legalities of two in-laws who passed away within 3 months of one another early this year...

Perhaps, faced with the constraints of time, I'll have to content myself by simply dusting-off my venerable 2x203A p-p Colpits "Rollins Rocket" & using it again this year---that, & incorporating some kind of muting system in the HB superhet that will still permit me to monitor my own on-the-air signal...

I'd rather use it than the Drake R-4 receiver that I employed last year, in keeping with the spirit of things!

And this year's issue is the first to use full color on the covers,
and on one section of interior pages, showing off Dave Bart's
illustrations of vintage communications posters to best advantage.

Editor Bob Murray promises similar color sections in future issues.

Hi Neil and thanks for the heads-up! It hardly seems a year has gone by since I was feverishly putting my '29 TNT together just for the contest. I think Bruce was looking down on all of us last year as both weekends saw unbelievably good conditions. I only hope that we can come close to those conditions once again.

I had fully intended to have some sort of amplifier (single 210) to follow the TNT, simply to get away from the antenna loading effects, should I experience such violent wind condx again this year but alas there have been too many other projects competing. After last year's contest I know that my new vertical is pretty wind-resistant and unless I get another 90 mph storm like last year, I should be OK.

I think this year I will run my new Hull Hartley on both 40 and 80. I haven't built the 40m coil for it yet but if it even approaches the note quality that it produces on 80, I will be very happy. I know Lou would prefer that I sound like r.a.c. and have to chase me up and down the band but Hull really did his homework on that design!

Hi Guys,

Were it not for major distractions in my life for the better part of this year, I was planning to design & build my version of the famous W9TO electronic keyer for use in this year's fray---the only difference (with a nod to things "...1929-ish", of course!) would be that I'd use separate 227 triode tubes, as opposed to a multitude of 12AU7's, as were employed in the original design...!

Yeah, I know, such a behemoth STILL wouldn't be kosher---but what the heck?! It'd be a blast to see rows of 227's all aglow, generating dits & dahs a la "...CQ AWA", right...?

Who knows---I might still do just that in time for 2011...gotta get my mitts on a cache of good, used 227's first, though!

965. Missing Flea Market Purchases at Conference

Yahoo group: AWAGroup (2010 — 2011)

From: Larry Szendrei
Topic: 965 Message: 965

Hi,

I was in hunter/gatherer mode at the Conference flea market and sometime on Thursday I spaced out and lost some stuff I had bought.

I am missing about about 5 brown ceramic beehives (some were in pretty rough shape), and a globe Taylor 866 mercury vapor tube. They were in a white plastic grocery bag (IIRC). I probably left them on someone's table,
or possibly at the book fair.

It's a long shot, but if any one reading this found them, I will gladly pay for postage to have them sent to me.

73,
-Larry/NE1S

968. Plug In RX Coils - Standard Config?

Yahoo group: AWAGroup (2010 — 2011)
Date: 2010-08-29 04:19:59 UTC
From: Bruce W1UJR
Topic: 968 Message: 968

Hello all,

I'm in the middle of getting a 1934 regen running, it is based on the 3 tube Doerle A/C set design.
It uses two coils, one in the RF with 4 pins and other other, a 6 pin, in the Detector circuit.
In the information which came with the set, which is based on one of Gernsback's small books, entitled "How To Build 4 Doerle Short Wave Sets", the author suggests not winding your own coils, but rather to use the commercial variety for ease of construction.

The set came with one set of coils, which are wound to match the set wiring.
However, I've got other Bud, ICS and Philmore coils which follow a different scheme.
Let me explain:

On the coils which came with the set, the six pin socket is wired as follows:

Pins 1-6, heater pins, are one coil
Pins 2-3 and 4-5 are two more sets of coils.

On the Bud, ICS and Philmore coils, the pattern in different:
1-2 are one coil
3-4 and 5-6 are another

I'd like to convert the set over to use the more "standard" coil layout, but before I do so, I wanted to check with the group and see what they have found.
Are commercial coils wound on the 1-6, 2-3 and 4-5 layout, or do most follow the 1-2, 3-4, 5-6 design?

So, in summary:

1) Was there any standardization back in the day on plug in commercial coil forms?
2) If so, were the primary, secondary and tickler windings standardized in a particular pin layout?

Thanks for your time and information!

969. Wanted - Schematic for Metrodyne "Special Six"

Yahoo group: AWAGroup (2010 — 2011)
Date: 2010-08-29 19:11:17 UTC
From: Larry Szendrei
Topic: 969 Message: 969

Hello,

I am looking for a schematic for a Metrodyne Special Six - I have one on my bench I am restoring to operation. Several of the cartridge resistors have very high resistance values - tens or hundreds of megohms - or are altogether open. The highest value of resistor I expect to encounter is the grid leak resistor in the detector, which reads a few megohms and is probably OK (it's adjustable, too).

This is a mid-1920's three-dialer TRF. Note it's a "special Six," not a "Super Six."

Any help appreciated. Could not locate it in Riders Volume I under that name. If I can't locate a schematic with values I'll reverse-engineer it - i.e., trace out my own schematic - and figure out reasonable values. Then I'll tack suitable 1/4 watt resistors onto the underside of the defective cartridges out-of sight.

Thanks,

-Larry/NE1S

Hello,

Just wondering if any of you folks could help somebody new, with an interest in the history, with a few questions.

I have just acquired a Hallicrafters Super Defiant which I am restoring. I am new to the hobby:

A few questions for someone who has a few moments:

a) what is the best antenna: is a north/south orientation important
b) any tips on operating the bfo
c) what is the best band to receive cw or other long distance reception

I am very grateful for your time in advance, Dusty.

The reception pattern of the antenna will depend on many factors: how
long it is (in terms of the wavelength of interest), height above
ground, nearby metal objects, etc. From which directions do you wish to
receive?
> b) any tips on operating the bfo
Turn it off when receiving AM! When receiving CW or SSB, first tune in
the signal for maximum strength on the R meter with the BFO off, then
turn on the BFO and adjust the BFO frequency for desired audio tone
frequency (CW), or intelligible speech (SSB).
> c) what is the best band to receive cw or other long distance reception
Depends on the time of day. The higher frequencies (up the the MUF, or
Maximum Usable Frequency) during the day, and the lower bands (160M -
40M) at night, will provide the best DX. There is good information on
radio wave propagation in the various amateur and antenna handbooks,
which will answer this question in detail.

979. RE: Questions from a ham going to be

Yahoo group: AWAGroup (2010 — 2011)
Date: 2010-09-08 19:25:51 UTC
From: JAMES HANLON
Topic: 979 Message: 979

Dusty,

Welcome! I have some additional tips about the BFO in your SX-25, and some words about using the Crystal Filter.

When you want to copy CW or SSB signals, both of which will require using the BFO, adjust your receiver as follows. Turn the BFO on. Turn the AVC off (if there is a separate switch for AVC. If you do not turn the AVC off the BFO signal will swamp the AVC and it will cut the RF and IF gain of the receiver way back.) Turn the Audio Gain (volume) all the way up. Turn the RF gain (sensitivity) down to a point where the audio output of the receiver is at an acceptable level, and use the RF Gain (sensitivity) control as your volume control.

When you use the Crystal Filter, especially in the most selective position, you will hear the background noise "ringing" at a near-musical note. The ringing frequency can be varied by changing the BFO pitch control. As you tune across a CW signal, you will hear the signal peak at the "ringing" frequency on one side of zero beat but not on the other side. That peak frequency is, of course, where you want to tune your desired CW signal. The crystal filter will also have a Crystal Phasing control. That control adjusts a "notch" across the passband. If there is an unwanted signal that is interfering with a signal you want to listen to, you can set the notch on top of the unwanted signal and attenuate it considerably without affecting a signal that you have tuned in on the peak frequency. (The notch won't tune to the peak frequency.)

When you want to receive SSB, the BFO pitch should be tuned to somewhere near the lowest ringing frequency which should be the center of the IF passband if the receiver is properly aligned. You can adjust the BFO pitch a bit for better SSB intelligibility if necessary. If you want to use the crystal filter for better selectivity when tuning in SSB, start with it on a less selective or "Broad Xtal" position. You may find you need to set the BFO up from the lowest pitch ringing point for best SSB reception with the crystal filter. It will probably sound best with the BFO tuned to one side of the passband for 80 and 40 meter SSB signals (which are normally Lower Sideband signals) and on the other side of the passband for 20 meter and above SSB signals (which are normally Upper Sideband signals). You will have to find out which side of the passband to use by trial and error.

Have fun and 73!

Jim, W8KGI

Come to think of it, isn't any oscillator "self-excited" by definition?

What is popularly meant by the term, of course, is some flavor of LC oscillator fed directly into an antenna.

Hi Lou,

Temper, temper...!!!

By rights, the use of self-excited rigs was NEVER banned, as such---but rules & regulations did come into place discouraging excessively wide signals, or signals that would cause interference with adjacent stations...

This includes the whole gamut of things ranging from drifty signals, to excessively chirpy signals, key clicks, poor signal tone, etc. etc.

And as we all probably know only too well by now, you certainly do NOT need a self-excited rig, particularly, to generate any one of those "...no-nos", either!

Eddy

In the same way spark rigs were never explicitly banned either, they
just couldn't meet the Jan 1, 1929 regulations for all that Eddy mentioned.

In the same way spark rigs were never explicitly banned either, they
just couldn't meet the Jan 1, 1929 regulations for all that Eddy mentioned.

Sure, the xtal replaces and LC tank for setting the frequency, but the
oscillator is still "self-excited." (If it isn't, what does the "exciting?")

No need for an apology, Lou. The problem is one of inexact language, but you're not the 1st one who used it in this case. I was merely trying to clear up the confusion in my reply, and to provoke some thought on the actual meaning of the words.

Unless an oscillator is "disciplined" it is self controlled. Some are more stable than others. There are primary and secondary sources of frequency. Again, some are more stable than others. A disciplined oscillator is one that is somehow locked to a source that is considerably more stable in a given time period than the original would be without disciplining. In the big picture, a simple crystal oscillator is not that great as you can in an uncontrolled environment only achieve at best about 1 part in a million timing accuracy, or frequency as they are reciprocals. Putting oscillators in a circuit with temperature compensation can improve on this performance, and, putting them in ovens of constant temperature can improve it even more. Crystal oscillators can also be disciplined by a Rubidium or a better yet Cesium atom oscillators which resonate at a very precise time interval when in an excited state and the timing between the electrons jumping back and forth between valance bands is know and can be measured and then controlled within a loop to the crystal. A Hydrogen Maser is the best. In today's world, GPS is considered a very good reference and most military oscillators are disciplined to GPS satellites, as well as your cell phones, each of which has a Cesium on board and are further controlled by earth stations with Hydrogen Masers. So, as someone real smart said, a long time ago, "it is all relative". This BTW is the short simple explanation without any heavy math or physics. In the USA, NIST is the keeper of time and frequency. 73 - Mike

Subject: RE: [AWA Group] Self-excited Osc. Rig Use Cut-off Date?

Unless an oscillator is "disciplined" it is self controlled. Some are more stable than others. There are primary and secondary sources of frequency. Again, some are more stable than others. A disciplined oscillator is one that is somehow locked to a source that is considerably more stable in a given time period than the original would be without disciplining. In the big picture, a simple crystal oscillator is not that great as you can in an uncontrolled environment only achieve at best about 1 part in a million timing accuracy, or frequency as they are reciprocals. Putting oscillators in a circuit with temperature compensation can improve on this performance, and, putting them in ovens of constant temperature can improve it even more. Crystal oscillators can also be disciplined by a Rubidium or a better yet Cesium atom oscillators which resonate at a very precise time interval when in an excited state and the timing between the electrons jumping back and forth between valance bands is know and can be measured and then controlled within a loop to the crystal. A Hydrogen Maser is the best. In today's world, GPS is considered a very good reference and most military oscillators are disciplined to GPS satellites, as well as your cell phones, each of which has a Cesium on board and are further controlled by earth stations with Hydrogen Masers. So, as someone real smart said, a long time ago, "it is all relative". This BTW is the short simple explanation without any heavy

math or physics. In the USA, NIST is the keeper of time and frequency. 73 - Mike

Just an FYI for those who haven't visited the AWA video section on you tube (http://www.youtube.com/user/AWAMuseum). Roy Wildermuth has been busy! Good stuff from this years convention. He has also been hard at work with the conversion of many of the old AWA videos to Youtube. If you have a chance check out the manufacturing video from SPEED tubes that must be from the late 20's. Updated with some super music and Video titles as the original was a silent film.

I'm not sure if Roy is a member of this Yahoo Group, but if he is let me extent my compliments on a job very well done.

I have about 5 lbs or more of DX cards from the estate of a silent key. There has to be easily several hundred cards or more. Most of them seem to be from the 70s but I have other cards from his station that date back to the 20s. There may be some of that era in there..

First person who wants them can have them for the price of shipping, $10?

Thanks

1000. Schematic wanted for Buckingham battery set

Yahoo group: AWAGroup (2010 — 2011)
Date: 2010-09-14 13:36:01 UTC
From: Larry Szendrei
Topic: 1000 Message: 1000

All,

I am looking for a schematic and battery hook-up info on a mid-1920s battery set manufactured by the Buckingham Radio Corporation. I can not locate any model name or number on the unit.

The set has a simulated wood-grain metal panel and single-dial tuning with a lit filmstrip-style dial, and uses six 4-pin triodes - I assume UX-'01As (3 stages of RF, detector, 2 stages audio). The wiring in my set had been modified, and I traced it out yesterday and corrected some obvious problems, but the battery connections (especially what appears to be C bias battery connections) are ambiguous. I hooked it up to my supplies in a way that made sense to me, but was unsuccessful in receiving any stations. The audio stages appear to be working.

I was unable to locate it in Riders, and Beitman's is too recent. Any assistance is appreciated.

Thanks,
-Larry/NE1S

1002. "Mystery" Regen Set For 1990s era AWA Conference

Yahoo group: AWAGroup (2010 — 2011)
Date: 2010-09-25 17:49:22 UTC
From: Bruce W1UJR
Topic: 1002 Message: 1002

Hello all,

The rest of the items I had in storage in Buffalo for nearly 10 years have arrived in Maine.
I'm busy rooting through what I forgot I packed so many years ago, its like a hamfest, abet this one is inside a metal shipping container.

One of things which I eagerly sought out, and finally found, was a neat little regen set which I picked up at the AWA Conference many years ago.
Over the last few years I'm become increasingly fascinated with regen sets, and fondly remembered packing this one away.
Thankfully it survived the 10 years in storage and the trip to Maine just fine.

Photos at -->> http://gallery.me.com/brucehowes/100587

Back to my question, it was at the Rochester location that I purchased this set, but I can't recall the year, would be between 1995 and 2001, the first year when I got my ham ticket, the last when I moved from NY.
I seem to recall the seller telling me that he bought the set in the AWA Auction the early earlier, but have not found any of my documentation about it, may still be packed away.
I also seem to recall that he might have mentioned Jim Hanlon, and it seems that I spoke with the builder, or exchanged letters with him some time back. Sadly, the rest is lost to history and memory.

If you recognize this set, or it is one of your creations, I'd really like to hear from you.
The set plays wonderfully, very smooth in and out of regeneration, and nice audio into a set of old cans.

Thanks!

Cordially,
Bruce J. Howes W1UJR

Lou,
Many thanks for bringing up the Eddystone User group site.I almost forgot about it! Your comment about spending the rest of the day reading is true, since there are mnany fascinating topics to read about.

I posted a WTB on their site about a case for my Eddystone S750 and got a few replies. I should have a case here delivered by hand sometime next year if all goes well.

I hope all is well woth you and we need to play "ketchup" sometime soon. May I have your telephone number again via private email? I have lots of "stuff" to talk to you about.

Hope to hear from you soon and very best regards.

Just per chance tonight I came across the paperwork for the regen set I had asked about earlier today.

The builder was Ralph Michelson KF8FA, from Brighton, MI.
I did find an email for Ralph, kg8fa@..., but it bounces.

I would be very interested in speaking with him.
Does anyone know if Ralph is still around, or have another method to contact?

I'll be scanning and posting the images and Ralph's notes on my website in
the next few days.

Hi Steve,
I still have an 830B (50-watt bottle) in my TX but I built a new PA stage using an 860.
I have to check it out to see if the shielding is good enough to avoid neutralization. The present HV supply is good up to a KV but I think the 860 will take more than that. I am in the process of building a hernia maker HV supply. I think my stuff me be of a slightly later period than what most of you guys are using. The TX is based on a 1934 design and at present I am using a FBXA RX.

I copied the QSL stuff.

1016. EICO 717 Electronic Keyer

Yahoo group: AWAGroup (2010 — 2011)
Date: 2010-10-06 21:27:10 UTC
From: Edward Swynar
Topic: 1016 Message: 1016

Hi Guys,

This little offering doubtlessly just wouldn't be topical enough for the Hints & Kinks section of "QST"...! No matter: it just may be of interest to those owners (are there any even left out there, reading this...?!) of the vintage EICO 717 tube-type electronic keyer...

Specifically, have you ever noticed that your actual keyed on-the-air signal---NOT the monitored audio signal from the 717 itself!---evokes memories of "contact bounce" with just the very first series of dots you send...? And is your very first dash in a string of dashes noticeably longer than the ones following it...?

I did with the unit I acquired here last Spring (serial #140-09-9959). I checked---and re-checked---the voltages & resistances of the tubes, and found all of the readings to be well within tolerance. I even bypassed the key output lead, the dot & dash terminals, AND the AC line cord with disc capacitors & RF chokes, on the assumption that RF was gtting into the "innards" of the keyer, & affecting it...

The problem persisted, until finally on a whim, I replaced V4---the 12AU7A dual-triode dot multivibrator---with a 12AX7 dual-triode. Voila! The gibberish is gone when first sending dots, and the dashes are all the same length now...

"F.W.I.W."...hey, where else are you gonna dig-up nuggets of information like this anyway...?! :>)

Hey Eddy that's great filing information for me as I have three 717's on the shelf in the basement. I first used on in the mid-70's at a Field Day. It wasn't mine but I sure liked how it worked. So throughout the years I'd periodically come across one at a fest for cheap, usually $10 or less, and I'd just have to buy it. Plus they are classy looking keyers, much prettier than the Hallicrafters HA-1! Now if I could only develop the nack of using three paddles at once, hi hi.

Your little "Hints & Kinks" will go into my Eico folder with all the other manuals. Just for that day I encounter the same phenomena.

Hi Guys,

This little offering doubtlessly just wouldn't be topical enough for the Hints & Kinks section of "QST"...! No matter: it just may be of interest to those owners (are there any even left out there, reading this...?!) of the vintage EICO 717 tube-type electronic keyer...

Specifically, have you ever noticed that your actual keyed on-the-air signal---NOT the monitored audio signal from the 717 itself!---evokes memories of "contact bounce" with just the very first series of dots you send...? And is your very first dash in a string of dashes noticeably longer than the ones following it...?

I did with the unit I acquired here last Spring (serial #140-09-9959). I checked---and re-checked---the voltages & resistances of the tubes, and

found all of the readings to be well within tolerance. I even bypassed the key output lead, the dot & dash terminals, AND the AC line cord with disc capacitors & RF chokes, on the assumption that RF was gtting into the "innards" of the keyer, & affecting it...

The problem persisted, until finally on a whim, I replaced V4---the 12AU7A dual-triode dot multivibrator---with a 12AX7 dual-triode. Voila! The gibberish is gone when first sending dots, and the dashes are all the same length now...

"F.W.I.W."...hey, where else are you gonna dig-up nuggets of information like this anyway...?! :>)

1020. EICO 717 Electronic Keyer: EPILOGUE

Yahoo group: AWAGroup (2010 — 2011)
Date: 2010-10-11 13:32:11 UTC
From: Edward Swynar
Topic: 1020 Message: 1020

Hi Again All,

Many thanks for the many personal notes that I've received from you all in the matter of the EICO 717 electronic keyer...interesting that MORE than a few of you have gone on record as saying the 717 was not worth the effort of assembling, in that it never did work right! Hi Hi.

Well, I've had my share of travails here with mine, too, make no mistake about it...however, I really & truly do believe that any inherent oddities that came with the keyer that I acquired earlier this year have finally been "cured".

For those who may still have an EICO 717 sitting forlornly and unused on a shelf, please try these fixes BEFORE you completely give-up on the thing. I can honestly tell you they worked for me!

(1) As mentioned in a previous posting, the keyer benefited from an "...RFI-proofing" retrofit that consisted of nothing more elaborate than series-installed 2.5-mh. RF chokes in the output key terminal, & in the dot & dash input terminals. These chokes were in turn all bypassed with 0.001-ufd. disk ceramic capacitors to ground, as well, right at the each terminal. Additionally, the AC power cord leads were bypassed to ground with 0.001-ufd. caps at their entry points to the keyer chassis.

(2) Also mentioned earlier was the fact that the problems of initial dot "contact bounce" effect, and an inordinately long initial dash, were both cured by directly replacing V4---the 12AU7 dot multivibrator---with a 12AX7.

(3) If your keyer sends "mixed" characters mid-stream, replace V3---the 12AU7 master oscillator---with a 12AX7.

(4) If this latter swap doesn't "clean-up" the keyer's mid-stream character formation, look at the heptode portion of V2, i.e. the ECH81 "keyer tube". I found with my 717 that the ideal ECH81 in this stage is one that is relatively weak. Specifically, by using an ECH81 with a measured transconductance of 1500-mhos., the problem of mixed-up character formation was cured. By contrast & for confirmation, I temporarily subbed-in an ECH81 with a transconductance of 3175-mhos., & the issue returned---with a vengeance. Even a tube displaying 1780-mhos. was essentially unuseable in this application.

If your junque box yields no replacement ECH81's, try simply swapping the positions of the two already in your keyer. If that doesn't work, begin the hunt for a 6AJ8 tube, which is listed as being a direct American replacement for the ECH81 tube (why EICO elected to use these tubes is a mystery to me...musta been a "good idea at the time"! Hi Hi).

The July 1967 QST Product Review was of little assistance in regard to my keyer here: the write-up quotes a total of 9 tubes in the 717---mine only has 6. I can only surmise that EICO made changes in the design of the keyer, & that I have either a newer, or older, example than the one described (the serial number of mine is 140-09-9959).

The only issue with this keyer now is one of operator error: I've become so very spoiled by the modern-day built-in electronic keyers in my Yaesus & Icoms---what with their buffer memories that allow me to actually "lead" the keyer, and all---that I continue to make errors in my character formation that are due to my own personal sloppiness! Old habits are hard to break, alright, but I'm attempting to do just that, right now, as I mate the 717 with a pair of Drake Twins here in my back-up station, & make QSOs on 40- and 160-meters...

The moral of all this...? Do NOT give-up on that EICO 717! There is life remaining in that ol' buggy yet...and all it needs is some TLC to bring it back to an active position within your shack!

1021. EICO 717 Electronic Keyer POST SCRIPT!

Yahoo group: AWAGroup (2010 — 2011)
Date: 2010-10-11 14:47:10 UTC
From: Edward Swynar
Topic: 1021 Message: 1021

Hi Again All,

As fate would have it (or is Murphy...?!), I neglected to remind trouble-shooters of the EICO 717 electronic keyer of this VERY important singular fact, i.e.

DO NOT USE THE INTERNAL AUDIO OSCILLATOR WHEN MAKING ANY OF YOUR KEYING ASSESSMENTS AND TESTING!!!

You MUST monitor your progress through the ACTUAL KEYED TERMINALS at the back of the 717, i.e. the ones that are activated by the reed switch. This can be your CW transmitter connected to a dummy load, or a separate external audio oscillator---whatever.

The internal audio oscillator is NOT keyed by the 717's reed switch, and so can not be trusted to guage your progress...

Apologies for my having omitted this important detail in my earlier posting...and a request to any & all EICO 717 owners who may try the afforementioned "fixes" on their own units, for details as to their effectiveness in your own situation ...!

Eddy thanks for all the additional insights into the 717. It's funny (or sad) at how many problems there seems to be with simple vacuum tube logic performance in something as easy as generating dots and dashes. My Hallicrafter HA-1 is also prone to strange keying. I have to keep the "ratio" adjustment set just right for it to work properly or it will give me an extra dot here and there when sending. It's frunstrating that tubes seem to be so critical when we are driving them between extreme on and off conditions. Gosh if we encounter all these problems with simple keyer circuits how did they ever keep the early vacuum tube computers running. Were they ever really able to get any trustworthy calculations out of those systems? A random extra dot is one thing and extra erratic bit in a calculation is something else. I assume they had check sums in those computers, but I bet it was a continuous maintenance job to fix logic errors.

My regards to all hands!

I hope I don't get myself in trouble with the AWA group for this email.

I recently acquired a rather nice RME-69. It needs the usual re-capping, etc. Mechanically, it appears to be about 90 percent. I am looking for an original RME speaker or speaker housing and either the RME or Navy version of the DB-20 preselector.

I would swap a spare, restored SW-3. It comes with homebrew (Jim Fred) bandspread coils for 40 and 80 meters. It has 6.3 volt tubes in it but NO power supply is provided.

It is best to contact me by email. With two teenage grandsons, I seldom get to use the phone and messages always fall through the cracks.

If I have broken any rules or offended anyone, my apologies are herewith tendered.

Hi Mike,
I have been a AWA member for a couple of yearsbut only joined the Yahoo group about a year ago. Lou, VE3AWA, finally convinced me.

I was amazed at how clean this unit looks. Someone took some TLC with it. I look forward to using it in the Cundhall/Robbins Test.

I've seen the speaker enclosure for the RME-69, rather an odd shape. If the SW-3 is not to your liking, we can figure something out, when the time comes.

BTW: Thanks.

Happy Birthday! Your just a kid.....I'm 70. :) :)

The condition of the actual speaker is a secondary issue. It can always be replaced by a new speaker and transformer. I don't have a manual yet but the 42 likes something around 4000 ohms plate load (if memory serves me). I picked up rather seedy looking manual copy off the BAMA website.

Take care and stay well.

From: JAMES HANLON
Topic: 1028 Message: 1028

I have an RME 69 speaker that came, of course, with my RME 69. The cabinet shape is a trapezoid, with the speaker in the smaller, parallel face. Both the receiver and the speaker were once the property of The Ohio State University's Electrical Engineering Department. They probably used it as a "bridge detector" in the student labs.

Hi Roger,

The output transformer for the 42 is on the RME-69 chassis. The secondary of this transformer will match 4000 ohms or 500 ohms. I don't know if the transformer in the original speaker cabinet for this rcvr matched 4000 ohms to voice coil, or 500 ohms to voice coil.

I have an RME speaker cabinet with a 500 ohm-to-voice coil transformer installed in it which appears original, and although I don't know if this unit was intended to be used with the RME-69, it sure sounds sweet with mine. I use this same speaker with a plethora of other receivers here at NE1S, as well.

Hi Larry,
Thanks for the input. All info is appreciated. I just got the manual which I only rate as
fair. The parts list is missing. Luckily, I downloaded an RME-69 manual from BAMA and
it has a complete parts list.

Now the fun begins; melting the innards out of the old wax/paper caps and testing
the "body-end-dot" resistors. I have done a number of National RX but this is my first
RME.

Take care.

Hi Roger,

The output transformer for the 42 is on the RME-69 chassis. The secondary of this
transformer will match 4000 ohms or 500 ohms. I don't know if the transformer in the
original speaker cabinet for this rcvr matched 4000 ohms to voice coil, or 500 ohms to
voice coil.

I have an RME speaker cabinet with a 500 ohm-to-voice coil transformer installed in it
which appears original, and although I don't know if this unit was intended to be used with
the RME-69, it sure sounds sweet with mine. I use this same speaker with a plethora of
other receivers here at NE1S, as well.

Hi Jiim--

Were you offereing it for sale?

I have a 69 without one,

If so, advise price.

Marc

I have an RME 69 speaker that came, of course, with my RME 69. The cabinet shape is a trapezoid, with the speaker in the smaller, parallel face. Both the receiver and the speaker were once the property of The Ohio State University's Electrical Engineering Department. They probably used it as a "bridge detector" in the student labs.

Roger,

You mentioned that you would be recapping your RME-69. I have an RME-69 and an RME-70 that are both running on the original set of capacitors and resistors. You might want to check the caps in your set for bad leakage before doing a wholesale recapping job.

Hello group! Since I am a new member, Louis Vermond asked me to post the progress of my 1929 Hartley project. I've been interested in early radios since becoming a ham in 2009 and built an Armstrong Regenerative Receiver from a kit from Borden Radio in Houston. I later found Scott Freeburg's AWA article and decided to give building the Hartley a try. I am not an ET or anything close to that, but I can follow plans and don't mind asking questions from those more knowledgable than me.

I am nearly finished gathering or making the parts that I need, and a friend will help me with the final assembly. From Ebay I found my mica caps and my DC milliamp guage. Variable capacitors came from Playthings of the Past, and the tank coil from The Home Depot. I have wound the RF choke, but have a "storebought" one on order. Playing the role of what an "enterprising ham of the 1920's" would have done, I decided to build my capacitor dials, and they turned out to be acceptable for what I want to acheive. I plan to wind the 80 meter coil this week and think about final layout.

I will keep the group posted and will post photos as I have them.

All the best,
Terry Hall

Howdy Jim,
Thank you for your email re: my "new" RME-69. While my experience is not vast, I have found that 70 + year old parts tend to be unreliable. My unit came without a bottom plate and it was obvious the bypass caps were in poor shape. I go through a process of melting the old innards and pulling them out. I replace the innards with Mylar/Poly film caps
and reseal the ends.

I do appreciate your input. Take care and stay well.

Hi Roger,

My hats off to you on your "rebuilding" of the old caps. I've always wondered if you somehow identify the rebuilds? I'd hate to see a future owners pulling out all your nice Mylar/Poly internal caps since they still looked vintage.

I've toy'ed with the idea of using a hollow cardboard tube, like those found on coat hangers, and then place the new mylar/poly cap inside it. The remaining internal space would be filled with some sort of material (epoxy, wax, whatever) and then simply add a new body sticker via a graphic design done on a laser printer. I could make the body look old or even replicate the old capacitors design, but add a little text to the label indicating it is a rebuild and even add the date of the rebuild. That way any future owner, who pays attention, would see a vintage looking capacitor but would know it is relatively new.

So do you mark your restuffed caps so that future troubleshooter won't pull out your nice new rebuilds? I still lean more to what Jim Hanlon does and I only replace bad capacitors as needed. My HRO-5TA1 still has all it's original caps and it's over 60 years old. The SX-115 which I use all the time is all original parts, including the electrolytics. I do agree that after 70 years the parts would and could be unreliable. Heck I'm only 52 and I'm not that reliable - still I hope my XYL doesn't feel the need to replace me, hi.

On my first Hallicrafters S-40A rebuild, I removed and replaced all of the paper/wax caps. After completing the job I checked all of the old caps for value and leakage and darned if they weren't all fine !

Hi Don,
Thanks for the newsy email. Over the years I have played with reusing the beeswax or paraffin but found it melts so easily when you solder the part back in. The cooking scheme I use does not work with the resin-filled caps that were used after they stopped with the wax. I also tried filing some brown Phenolic and mixing the dust in the epoxy, I hesitate to describe what it looks like! All things considered, two-part epoxy seems to work well. The new film caps are so much smaller than the old paper/foil types they seem to fit in the old hulls easily. Electrolytics take a bit more work. For them, you can leave the
tubes where they are put new parts under the chassis. Of course, "stitch counters" will find the new parts. :) :)

I was able to scan an old Sprague 600 Line cap label and I have had excellent luck printing them and gluing them onto hulls. It takes a bit of tweaking to get the right background color. I use the same process with coil labels for the Hammarlund XP-53 coil forms. A bit of shirt cardboard and a new label and they look like the big city! If I can in any way, I'll try.

Hi Steve,
     Your lucky. For instance when I rebuilt my National FBXA, the resistors average 80 or more percent out of tolerance, the caps were closer but seemed on the edge of leaky. I have yet to get started on the RME-69. It appears to be in excellent mechanical condition with very little dust, no dead insects or rodent droppings. Maybe I'll get lucky on this one. Take care.

1044. "The Transmitter" Magazine?

Yahoo group: AWAGroup (2010 — 2011)
Date: 2010-10-19 00:15:51 UTC
From: Bruce W1UJR
Topic: 1044 Message: 1044

I came across a very intriguing publication entitled "The Transmitter"

Wonder if anyone has heard of this publication before?
I have issues Sept 1926 #1 to July 1927 #10.

Interesting publication, like a mini QST, in fact the same form factor
as the early issues of QST, just not quite lengthy.

Published by The Transmitter Publishing Co.
Sub. Floor, Wright Bldg.
Tulsa, OK

L.A. Sims, Editor and Business Mgr. (no call listed)
G.B. Small, Technical Editor (no call listed)

Sept 1926 appears to have been the inaugural issue, not sure when
they stopped publishing.
Standard line up of brand name advertisers one would expect to see in that era,
not quite the range of QST, Cardwell seems to have really been one of the heavy hitters in
the early editions.

Interesting articles, was just reading one on "Lunar Influences On Radio Reception"
in the September 1926 issue!
Really, but then again, all kinds of theories back in the day,
right?

Does this sound familiar with anyone, any info on the background of this company,
this has really gotten me quite interested.

Thanks!

Cordially,
Bruce J. Howes W1UJR

Good find Bruce. I have just the October 1926 issue. Back in 1998 (via the email archives) I posted a similar request. I got one reply from Ed Sharpe (SMECC Archivist) saying he had three issues, but knew nothing of it's history.

I'm afraid this is going to need the "History Detectives" Bruce. I wish you luck as I'm sure it would make a great article. You might try the district reports in QST that cover the Oklahoma area in that time frame.

Bruce -

In this case yours was pretty easy as ebay showed a "u**j" as the winner. I do not know what it shows for me, since for me it shows the whole thing, which is my call. I bid the last few seconds, so, did not even look at the list till the end. The beers are no problem, HI, but, I am sure you can afford your own. This was still a great buy in my opinion. Have fun with the slide rule. In college we did not have calculators. 73 - Mike

From: Edward Swynar
Topic: 1052 Message: 1052

Hi Scott,

I just received my newest copy of The AWA Journal here, and was absolutely delighted when I read your words in the "Amateur Radio" column therein, i.e.:

"...Contacts only count for scoring if made with another 1929 or earlier station. Except that contacts made with non AWA visitors, with modern equipment, who are seeking information about the contest, may be counted. This is an excellent way to generate interest in our event..." (italices mine)

Bravo, Scott...! This progressive change in the rules has been a VERY long time in coming, and I welcome it with open arms...

As you know, I've been trying to get the powers-that-be to re-examine the non-sensical dis-allowance of QSOs made with the "curious" for some years now---all of my suggestions & offerings of help repeatedly fell upon deaf ears...

I don't know how you did it, Scott, but I'm glad you did---and I salute you for your success!

Maybe now future potential AWA members won't have the proverbial door slammed in their faces, as they gamely venture forth to see what all this chirping & yodelling stuff on the bands is all about each & every December!

wow Eddy....I did not even notice this! That is good news and hopefully we can attract some more (and much needed) attention during the contest as others hear our exchanges with non-29ers!

Well done Scott! Hopefully for next year, we can see the '10W' input changed to a more practical '10W output' ;-)

Below just in on the Eddystone Users Group.

Can anyone help Ben wid this? 73, Lou VE3AWW

Bit off topic but worth a try

National NC logo

Would anyone have one of the red diamond style NC logo badgers used on National speakers etc ?

I need to replace a missing one off a National Speaker box.

cheers, Ben G4BXD.

Hi Steve et al,

Well, I really & truly think that the conditions during this year's running of the Kelley affair will be much like we had last year---old Sol just ain't makin' with the pox on his face in any large way, & that usually bodes well for the lower frequency bands...

Steve, you really & truly put the "left coast" on the map, so-to-speak, with your absolutely stellar---and quite frankly, amazing---performance last December. I only hope that a few of the guys out W6-W7-VE7 way will remember how you proved that it can, indeed, be done---even by a first-timer! (Hopefully the shame has yet to wear off from your peers out that way, Hi Hi!).

This year I plan to run my 3x227 MOPA on both bands. I debated about using the HB 12-tube 1929 superhet, but I just never got around to configure any good way to control its gain, such that it might better serve as a signal monitor, too (and I really don't want to add AGC, in keeping with the technology of the day). Most likely I'll dust off the old Drake R-4, & use it for my "ears"...there's nothing but tubes inside it, so at least the glow-in-the-dark spirit will still be there!

Hi Scott and great to hear from you! I'll be on for both weekends hopefully...not sure if I'll use the Hull Hartley or the TNT, maybe both.

We will be really lucky if conditions are even half as good as they were last year as last year both weekends were as good as it gets. Several of the east coaster 245's were a true 599 here as the sun came up back east and the Rollins Rocket was shaking my table....what a contest!!

Here's a trivia tidbit: in the Boris Karloff version of Frankenstien, it was Colin Clive who
uttered "It's Alive.....", circa 1932.

1070. Bruce Kelly 1929 QSO Party Rules and Info

Yahoo group: AWAGroup (2010 — 2011)
Date: 2010-11-09 14:35:00 UTC
From: whitebear1122@comcast.net
Topic: 1070 Message: 1070

It's that time of the year again when 40m and 80m static finally quiets enough to let us hear those beautiful warbles and chirps from our 1929 radios. While I know some of the guys use their 1929 gear all year long, most of us will be dusting the rigs off and setting them up for the December run. Here is the information for the upcoming 1929 QSO Party. I hope to hear and work each and every one of you 29 guys. I will be getting the logsheets up on the AWA website shortly. 73, Scott WA9WFA

The 2010 Bruce Kelley 1929 QSO Party

The Bruce Kelly 1929 QSO Party is a yearly AWA sponsored event where amateurs build their own transmitters using the designs, techniques, and tubes that were available in 1929 and earlier, and then put those classic transmitters on the air and try to contact as many other 1929 stations as possible. Since they use early designs, it is a cancatny of whooping, chirping, buzzing, clicking, drifting, swishing, swaying, worbling, and other interesting signals. This is what ham radio sounded like in 1929. Even if you’re not an amateur radio operator or don’t participate in the QSO Party, you may enjoy listening for the event and hearing those signals for yourself. The 1929 QSO Party was started and championed for many years by Bruce Kelly W2ICE, an AWA founder. Prior to Bruce’s passing, he asked his close friend John Rollins W1FPZ to keep the 29 QSO Party going. John Rollins championed the QSO party for many years and renamed it the Bruce Kelly 1929 QSO Party in honor of Bruce. A few years back John Rollins asked me to take over the 29 QSO Party and keep it going. Bruce Kelly and John Rollins are now Silent Keys and I know both John and Bruce will be with us in spirit.

Dates and Times: First two weekends of December, Saturday Dec 4 through Sunday Dec 5, and Saturday Dec 11 through Sunday Dec 12. Starts at 2300Z (6:00 PM EST) Saturday night and finishes at 2300Z (6:00 PM EST) Sunday night, both weekends.

Objective: Contact as many 1929 stations as possible. Contact exchange consists of RST, Name, QTH (State such as ME or MN or NY), last two digits of the year of the transmitters design or publication (such as 29 or 27 or 23), type of transmitter (such as TNT or TGTP or MOPA or COLPITTS), and power input (such as 6W or 9W).

Rules: Transmitters must be 1929 or earlier types of self oscillators such as the Hartley, TNT, PP tuned grid tuned plate, MOPA, Colpitts, etc. No crystal oscillators. Tubes must have been available during or before 1929. Individual stations can be worked only once on 80 meters and once on 40 meters over the course of two weekends. Contacts count for scoring if made with another 1929 or earlier station. Note this rule change: contacts made with non-AWA visitors with modern equipment who are seeking information about the event may be counted. Log a modern contact with "MOD" or "modern" on the TX column. You can use any vintage or modern receiver that you wish. The event is open to all amateurs operating 1929 style transmitters.

Input Power: Transmitters are limited to a power INPUT of 10 watts or less. However, to help make East-West contacts, power may be increased to 20 watts INPUT between the hours of 0500Z (12 Midnight EST) and 1300Z (8 AM EST). Note this is INPUT power. Power input is

calculated by multiplying PA plate voltage x total PA plate current. Example: my plate voltage is 300 volts dc, and my plate current is 30 ma, so my total input power is 300 x 0.030 = 9 watts input.

Frequencies: The QSO Party operates in both the 80 meter and 40 meter cw bands. The QSO Party typically operates between 3550 to 3580 Kcs and 7040 to 7060 Kcs, plus or minus depending on QRM, cw nets, and RTTY contests.

Logs: Either electronically email your 1929 log to Scott at wa9wfa@comcast.net or via post office mail to: Scott Freeberg WA9WFA, 327 Wildwood Avenue, White Bear Lake MN 55110. Logs must be in the 1929 QSO Party log format otherwise it will be difficult to score you. An official 1929 log sheet will be available for download from the AWA website. For an SASE I will mail you a paper log sheet, and you can I email me for a WORD logsheet.

Scoring: Scoring is simple. Add up the number of QSO’s on 40 meters and 80 meters. Example: if I make 15 QSO’s on 80 meters, and 10 QSO’s on 40 meters, my final score is 25. All submitted AWA logs will be scored and displayed in the results. Please submit logs by January 15, 2011.

Good luck to all participants! Please send me a photo of your 1929 station. Thanks. 73, Scott WA9WFA

Hi Scott,

Thanks for the timely reminder...!

I wonder if there are any newbie participants reading this who are just chomping at the bit, waiting to jump into the fray from the "left coast" in a concerted effort at accomplishing what Steve (VE7SL) did last year...?

His presence on the bands was surely one of the highlights for us Nor'easters in 2009, and was all the more notable by virtue of the fact that it marked (I believe) his first-time effort in the Kelley fray.

Looking forward to it at this end, no matter what...

1072. 1929 Bruce Kelly Contest Suggestions

Yahoo group: AWAGroup (2010 — 2011)
Date: 2010-11-10 16:42:25 UTC
From: JAMES HANLON
Topic: 1072 Message: 1072

Y'all,

Out here in the Southwest the signals in the 1929 contest are pretty few and far between. Unless I spend a lot of time tuning around the suggested band segments, which can get pretty tiresome with no results, I probably will miss good opportunities to make QSO's. To improve all of our chances in the Contest, let me suggest that we adopt a "calling frequency" on each band as a starting point. Let's come up on the calling frequency first, and if that is busy then let's spread out about that point. That way we can set our receivers to the calling frequency and if a signal comes on the air we'll be able to hear him and make a QSO without having to stay glued to the receiver tuning the band all the time.

Let me suggest that we use 3560 as our calling frequency on 80 and 7050 on 40.

Also, especially in times when activity is low, let me suggest that we make an extra effort to get on the air at specific times, say on the hour.

With a specific frequency and time to look for other QSO's, we would all have a better chance of working each other and having more fun on the contest.

What say? Any other ideas?

Jim Hanlon, W8KGI
Sandia Park, New Mexico

Hi Jim,

I like the calling frequencies idea, for when things get "lean" on the bands (especially 80-meters at around 2:00 AM - 5:00 AM here), but otherwise, the frequency limits in the rules are spelled-out well enough for me, personally...

I think Steve (VE7SL) should again post a discourse here as to just how, exactly, he did what he did last year...that should be inspirational for any & all far away who want to take part in this event, IMHO!

Eddy...it won't be much of a discourse but I just did what I usually do in contests...search and pounce....in fact very few of my QSO's were the result of a CQ on my part. With the numbers of participants in this affair and the associated difficulty of setting to an 'exact' frequency, the best way to make QSO's is to tune throughout the suggested segment and find stations already in QSO and call one of them at the end. Chances are that the other one will call you after that as well. Certainly when things get quiet, Jim's suggestion is a good one and we could all go back to the watering-hole frequency for a few CQ's.

It sure would be great to get more guys on from the West coast. I know a couple West Coasters were on last year but it's a struggle for them to hear the Midwest and East coast, and vise-a-verse. Luckily for us in the Midwest, the 1929 group has grown from 1 in 1998 to about 15 or 16 now spread across MN, WI and Ill. In some 29 QSO Parties, poor band conditions make the East Coast uncopiable so it's good to build a local contingent. I still recall 2 years ago hearing K6TQ (CA) make a brief appearance on 80m. At my MN qth he was just a skosh above the noise yet Harold KB0ROB gave him an S-6. Last year I don't think I worked any of the West Coasters other than VE7SL, and he was as loud as the East Coasters here, meaning S-3.

A West Coast ham who does not participate in the 29 QSO Party emailed me recently and suggested that a higher power catagory would be useful for those East/West contacts. He's talking much more power than the "after midnight 20 watt input catagory". He is building a push pull pair of 211's for 100 watts input and said he planned to work the 29 QSO party with it. While he knows his score won't count, I have no idea on how to score any contacts made with him as he is a 1929 build station but exceeding the power limits, not modern, nor making any inquires about the AWA because he already knows about them and the event. I imagine 50 watts output would be copiable all day and all night long. So an increased power is a suggestion that has been mentioned from time to time.

I know the Linc Cundall is a fine place for us to run high power 29 stations. Last year I ran my 10 watter and did pretty good in the event. A pair of 211's on 80m would be fabulous in that event.

I thinks it's a fine plan to hang around 7050 and 3560. What I recall from last Decembers 1929 QSO Party, 40 meter activity seemed to be focused in the 7044 to 7050 range if I recall. 80m activity was from 3560 to 3575 primarily, so it's not like the QSO Party is spread out across the band.

Around here the QRM is fierce from all the cw nets and the RTTY contests from around 7 pm till 10 pm so alot of times I don't start hearing stuff till all that noise goes away. Things sure got rougher when the ARRL/FCC closed down 3600 and above and forced 5000 cw nets into 3545-3565.

Good comments Scott and I am really looking forward to a repeat of last year's gentlemanly affair. Conditions last year were as good as they ever get and we will be very fortunate if they are as good again this time....fingers crossed.

Being way out here on the lonely left coast I would definitely support a power change ruling but not as drastic as a pair of 211's. Simply going from the stated '10W input' to '10W output' would make a huge difference for many...so just three small letters need to be changed. Heck, the powers that be (if they are truly even interested) might not even notice for a few years ;-)

Hi Guys,

I agree with Steve: the power rating should be in "watts OUTPUT", rather than "watts INPUT".

For one thing, the present rules discriminate against self-excited rigs---with their 30% efficiency---in favour of MOPAs (with an efficiency of around 60%, or more). By making OUTPUT power the criteria(sp?), the playing field would be levelled.

As for allowing 100-watts from self-excited rigs, I would strongly vote against it: can you just imagine if all those chirping / yodeling / whooping / groaning 1929-ish signals were to suddenly increase in strength on the bands by some 10-db-plus...?!

I could think of no better way for us to attract attention to ourselves & the AWA by encouraging that---the WRONG kind of attention, that is!

Steve, there is already a 'close to 10 watt out' portion of the event. At midnight the input power limit is upped to 20 watts input, so that could be close to 8 watts output single stage, a little more with the MOPA's.

Last year I was happy to crank up the power on the push pull Colpitts to 20 watts input at midnight. I was probably getting 9 some watts out. I wish more of the guys would do that. It does make a difference when we're scratching for signals right at the noise level. But by the time midnight rolls I'm well past bedtime and barely able to stay awake. Speaking of post-Midnight, I do miss the old days when I'd be sitting there at 1 in the morning, most of the guys have closed down, yet I'm still hearing the 1929 calls from W2ZM, KB0ROB, WA3FFC.

Eddy's comments about maybe changing from watts INPUT to watts OUTPUT make sense. 10 watts out would be awesome for the normal portion, maybe the 20 watts output for the midnight portion. Well we can chew on this for next years event.

Yes I absolutely agree that high power 1929 transmitters risks raising too much attention with the FCC. It's one thing with it's a chirpy S-2 signal barely above the noise, and generating less racket than someones Ipod charger. It's another thing with it's a chirpy 20 dB/S9 raising all kinds of red flags. It's kind of a Catch-22.

I was looking at the subject line of these posts and wanted to mention that John Rollins said to me several times that is not a contest, it's a QSO party. It's not all about the points. Sometimes I would slip up during a phone call or a postal letter and use the term 1929 contest. John would kindly point out the differences. hi hi hi I try to have a similar philosophy as retirement approaches on the distant horizon. The goal isn't to retire, the goal is to enjoy the ride along the way.

Simply going from the stated '10W input' to '10W output' would make a huge difference...

Eddy's comments about maybe changing from watts INPUT to watts OUTPUT make sense. 10 watts out would be awesome for the normal portion, maybe the 20 watts output for the midnight portion. Well we can chew on this for next years event.

Regarding Party rule changes, Scott is not the one to convince, Tim is. Out of respect to Bruce, Tim, and John before him, have vetoed any suggestions regarding rule changes. This was once again demonstrated at this years Convention's Ham Operations meeting. Tim would not allow discussion regarding the issue of changes to the Party rules.

I will take this opportunity to say that I did not renew my AWA membership this year. The reasons are unimportant to this discussion and, I will give, to any other. I will be participating in the Kelly Party though. My contacts not counting, and wanting to Party in the West and South, I will run my TPTG for all its worth...all 9.5 watts out.

Remember the party Warm-up tonight at 8 PM EST about 3560kc.

73, Lou VE3AWA

Just to stir the pot a bit....what might really be fun is our own AWA Builders Group sponsored 1929 160m Party...say in late January or February....power limit of 50W for example....'29 tubes only....xtal or self-excited. All of these TNTs and Hartleys come with coil-winding info (much easier regular wire) for 160 and the rigs would sound great down there...plus be a little more efficient. I'll bet that most CW operating back in the day was probably on 160m since it was so much easier to build for, and find the band on the top end of the parlor's radio dial.

Hi Steve,

If there ever is any sort of a re-kindling of a 160-meter AWA QSO Party (yeah, I can recall there being one there, once!), be prepared to keep all of the activity at the extreme bottom 10-KHz of the band...!

Topband is the pleasure palace of DX'ers during the hours of darkness: have a listen there any evening, & you'll either hear DX stations, or Stateside stations, calling "CQ DX", anywhere from 1810- to 1840-KHz.

I can just imagine the reception(!) our raucous 1929-style signals would get from die-hard stalwarts therein, if we all suddenly were to descend "...en masse" smack dab in the middle of prime DX territory...!

Attention Steve (VE7SL):

Would you please be kind enough to post a brief run-down here of your station, such as it was on the occasion of 2009's running of "The 1929 Bruce Kelley QSO Party"...?

What kinda power were you running...? What sorta tube / rig did you use...? What was your receiver...? What antenna(s) did you employ...? How high was it...? Was it oriented east-west...? Etc. Etc. Etc.

I think would-be participants out west could greatly benefit from a knowledge of what, exactly, you used when you scored as well as you did from BC (please refrain, however, from any reference to paralled 861 tubes and stacked rotatable rhombic antennas, with my thanks!). :>)

....from the lack of response I think the band is safe! I actually do almost all of my operating on 160m cw and from back here, there is rarely any DX activity below 1815 so I don't think we would be bothering anyone down at the end.... of course there is always the top end of the band as well.

> I can just imagine the reception(!) our raucous 1929-style signals would

The notes would probably be pretty darn impressive (dare I say "Collins-like") on topband...heck that might take all the fun out of it.

From: JAMES HANLON
Topic: 1085 Message: 1085

I've long since given up on a "winning the Contest" ,mentality since the number of QSO's I could possibly make is severely limited by my location - far away from most of the other participants. I do enjoy the "Party" aspect, but only if I can find other folks to talk to. It's not much of a party if no one else shows up - that is if the signals on the air don't come up above my noise level.

That being said, doesn't the event really belong to the people who participate in it? If the majority of the participants want a rule change, for example from "power input" to "power output" or from 10 watts maximum to 20 (or more) watts maximum all the time, there should be a way that we could effect that change to the rules. If the current person in charge of the contest doesn't want to cooperate, then perhaps we should ask him to step aside.

Hi Steve,

Well, give me the word here some day soon, & I might just be inspired enough to fire-up one of my 1929-ish creations on 160-meters (I had the forthought, fortunately, to build coils for that band for ALL of my creations!).

I could even take advantage of my DX set-up here for that band (it's my hang-out of choice during the winter months for CW DX), i.e. a 3-element inverted "L" triangular phased transmitting array (with my choice of 6 different points of the compass to beam to!), my two (E-W & N-S) K9AY loops, or my 1500 south-terminated Beverage!

The only thing is, the "regulars" on the band would think I've somehow taken leave of my senses, if they heard VE3CUI suddenly burping & yodelling away on the band...maybe if I use my VE3XZ callsign...?! Hmmmmm...

Hi Steve,

I forgot to ask you when, specifically, you're on 160...in the morning? If so, at what time...?

I'm usually on 1816-KHz, +/- QRM, each morning after 1000Z, or so. If there's no DX top be worked anywhere, I like to settle-in on that frequency & just call CQ for a rag chew with anyone who might hear me...

I've worked several west coast stations already this year---it'd be a treat to add your call into the Topband log here...

>Bruce Kelley QSO Party"...?

>What kinda power were you running...? What sorta tube / rig did you use...?

TNT using a single '10'...the actual transmitter can be seen here:

http://members.shaw.ca/ve7sl/tnt.html

> What was your receiver...?

I used my main-station transceiver, an FT-1000D.

>What antenna(s) did you employ...? How high was it...? Was it oriented
>east-west...? Etc. Etc. Etc.

Two antennas were used. My normal 80 and 40m 'half-slopers', fed at the top of the 48' tower. 'Half-slopers' work very well .... almost all of the radiation comes from the tower, not the sloping wire, which acts as more of an impedance matching 'stub'. In effect, the tower acts like a top-loaded vertical radiator. The problem with this antenna is that it relies heavily on top-loading so that all of the antennas on the tower (tri-bander and several vhf yagis plus associated masts and booms) all contribute to the top-hat. This requires a good electrical bond between all elements of the tower, mast, booms, and element-to-boom connections as well as the mast to rotator. With any wind at all, the small twisting moment in the antenna stack will quickly translate into very small impedance changes in the system which, in a modern rig, would be completely unnoticeable. Using a directly-coupled power oscillator into the antenna results in a lot of frequency jumping and warble if it is windy. For the contest I made a separate pair of wire verticals (tied tight and 'wind-proofed')...full-sized 1/4 wave wires going almost straight up to the top of a large Balsam and layed out four radials for both bands (80 and 40) just in case it got windy during the contest. I was fortunate to have this antenna as a back-up since we were hit with very big winds on both weekends, up to 90 knots. I was able to use my slopers for a bit on the second weekend but about 75% of my contacts were made on the untested newly deployed wires. Fortunately we were blessed with some of the best E-W low band propagation I have seen in a long time so likely any antenna would have worked well! The wire antennas were located about 20' from the edge of the ocean, looking out across 20+ miles of salt water facing to the east, which is probably worth another 6db at least.

Pay as much attention to your antenna system as you can...at these power levels you can't afford to waste a milliwatt.

If you are new to the 29 Party it is important to not give up early, as conditions will often change from hour to hour. Some of the best signals on 80m from the east coast were right at the east coast sunrise, so an early morning trip to the shack will likely pay off. Don't rule out 40m as well, as signals are usually much stronger (but wobblier). Unfortunately by the time it is dark back here, most of the easterners have already moved to 80m for the night...unfortunate.

Don't try and run a 1929 receiver unless you are very very patient...being able to hear the other guys is crucial. You will have enough trouble trying to zero-beat signals using a modern rx let alone trying to do it with a regen or something similar.

Don't waste a lot of time calling CQ's until you have searched-out and found / called all of the other stations that you can hear first.

Sending all of your information twice will often avoid having to re-send any missing bits.....have fun.

Steve / Mayne Island, BC

1090. 1929 QSO Party Musings and Preparation

Yahoo group: AWAGroup (2010 — 2011)
Date: 2010-11-12 14:52:35 UTC
From: whitebear1122@comcast.net
Topic: 1072 Message: 1090

I'm hoping to have time this weekend to start looking over my duo band Colpitts. I built it for 40m 2 or 3 years ago, and duo banded it last year. It worked pretty darn good and I love the fact that the capacitor frame is grounded so hand capacitance effects are very low to almost non-existant. Granted, my build is not anywhere as pretty as some of the masterpieces I've been seeing on Steves website. I do like looking over the photos of other transmitters to give me ideas for my own.

I've got a couple of pictures up here:
http://s810.photobucket.com/albums/zz29/wa9wfa/1929%20Colpitts%20Self%20Oscillating%

The stability on 40m suffered some when I duo banded it, possibly due to different fixed tank capacitors, and maybe from further degradation of the tank split stator capacitor. It's an ancient National "Girder" variable with some kind of early plastic supports for the isolated stator plate supporting rods. It's falling apart and every time I mess with the transmitter, those supports crack and move around. Even micromovement is not a good thing with these transmitters where any little change will translate into wobble or distress... I might have to bite the bullet this year and take that cap completely apart, remove the plastic supports, and see if I can make some news ones.

I had plans to update over the year and not wait till the last minute. Well here I am at the last minute.....

I am also building a K9AY 80m small loop antenna. I've got the controller electronics done and in a box with just one hole and connector to wire up. Got the mast electronics done. I'm hoping to raise the mast this weekend and get the wire in the air, add connectors to the 125' some feet of cables and run them from the shack to the lakeshore where the mast will be. I'll be lucky to get half of that done. The weekend needs one or two more days to get all tlhis stuff done.

Just for the sheer fun of it, I'm thinking of hooking up the National SW-5 on 80m for some of the local contacts in the QSO Party. I know several guys in the event use 2 and 3 tube regens, SW-3's etc for much of the QSO Party. I really admire them for being 100% 1929. Maybe I can use it to work the local MN, WI, IL guys and just see how it works for the long haul stuff later in the evening when things slow down. I'm sure the SW-5 will be a struggle early in the evening when trying to separate out 29 signals from all the CW nets.

I was recently looking over John Rollins TPTG article up on Bruce UJR's site. What a beauty that transmitter is. Might have to build one of those.. when I get the time. har har

I'm fairly sure I'm not the only guy doing all this stuff at the very last moment.

73, Scott WA9WFA

Steve,

My guess is that not everything got copied in the URL. When I encounter
these I try and remove some of the end of the presented URL. In this
case I just used the http://s810.photobucket.com/albums/zz29/wa9wfa
<http://s810.photobucket.com/albums/zz29/wa9wfa/1929%20Colpitts%20Self%20Oscillating%>
part and it takes me to Scott's picture area. You can then select the
29 transmitter stuff via the album links on the left side of the window.

BTW, when I'm in the 29 transmitter section I see that Scott's URL was
short the word "Transmitter/" at the end.

I saw this wonderful framed painting while visiting the New England Museum of Wireless and Steam earlier this year.
It is located at the top of the stairs leading into the room housing the Massie Wireless Station, and is, I assume, some sort of marketing piece.

I do apologize for the poor quality of the photo, the hall was somewhat dark, and the flash really messed things up.

Does anyone have any idea of the origin of this image?

Cordially,

I have seen this print many times. I am almost certain it is on the cover of one of the early QSTs. I will have to check downstairs later. 73 - Mike

Subject: [AWA] Photo/Painting - Can You ID This?

I saw this wonderful framed painting while visiting the New England Museum of Wireless and Steam earlier this year.
It is located at the top of the stairs leading into the room housing the Massie Wireless Station, and is, I assume, some sort of marketing piece.

I do apologize for the poor quality of the photo, the hall was somewhat dark, and the flash
really messed things up.

Does anyone have any idea of the origin of this image?

I believe, Mike that you will look in vain.

Bruce, maybe the Museum would supply a hi-rez scan? If so, sign me up.

Lou

It appears you are right. I have looked at all issues from Dec 1915 through Dec 1921, and, it is not there. Now that I have turned 65, my memory must be going south. I know I have seen it often, but, now I will have to remember where. It may also have been used in a Marconi advertisement. 73 - mike

1107. "Dress Rehearsal"...?

Yahoo group: AWAGroup (2010 — 2011)
Date: 2010-11-16 18:58:36 UTC
From: Edward Swynar
Topic: 1107 Message: 1107

Hi Guys,

Do I recall correctly Lou, Scott, Steve, or someone here referencing the fact that Wednesday nights were reserved for "...dress rehearsals" of the upcoming 1929 QSO Party...? If so, is this practice continuing...?

I hope to have my old 3x227 MOPA fired-up for testing between now & Wednesday eve---might be kinda fun for a shake-down cruise if I do get it going successfully...

What time---and what frequency---does this take place, if at all...?

Thanks in advance, & my vy

~73!~ de Eddy VE3CUI - VE3XZ

PS: For the duration of the Kelley affair I plan to use only my two-letter callsign, i.e. VE3XZ. Back in the good old days an "X" suffix was usually a special-issue moniker granted to leading-edge experimental stations. Now, the set-up here will be HARDLY leading-edge by even 1929 standards, but the call has a nice "ring" to it on CW.

So if you're wondering what may have become of perennial VE3CUI, look no further than VE3XZ...!

I hope to have my vertical back up tomorrow/Wednesday evening. If so,
I'll be on 3565 at 7PM CST with my Hartley and HRO Sr. I'm open to skeds
at later times also.

1110. Vibroplex "Vibrokeyer"

Yahoo group: AWAGroup (2010 — 2011)
Date: 2010-11-16 21:29:51 UTC
From: Edward Swynar
Topic: 1110 Message: 1110

Hi Guys,

My apologies for this impersonal "...shot gun" approach at e-mailing, but it IS a bit of a time-saver...!

I'm wondering if any of you reading this might know of the existence someplace of a lonely old Vibroplex "Vibrokeyer" that's looking for an appreciative, good home...? I've been thinking for some time now that I really should convert my first bug BACK to being just that, i.e. a bug, & replace it on the operating table with Vibroplex that's actually designed to be used with an electronic keyer.

The Vibrokeyer most certainly does NOT need to be of museum quality, & hopefully the price will be reasonable enough that I'll be able to afford presenting it to myself as a gift for Christmas! Hi Hi.

Many thanks in advance for your kind consideration & indulgence, & my vy

~73~ de Eddy VE3CUI - VE3XZ

Eddy,

If I don't make it just call CQ and then go to
http://www.reversebeacon.net/dxsd1/?f=0&c=w0vlz&t=dx subbing your call
for mine. The reverse beacon network will at least let you know if
you're getting out.

73,
Niel - W0VLZ

Subject: [AWA Group] Vibroplex "Vibrokeyer"

Hi Guys,

My apologies for this impersonal "...shot gun" approach at e-mailing, but it IS a bit of a time-saver...!

I'm wondering if any of you reading this might know of the existence someplace of a lonely old Vibroplex "Vibrokeyer" that's looking for an appreciative, good home...? I've been thinking for some time now that I really should convert my first bug BACK to being just that, i.e. a bug, & replace it on the operating table with Vibroplex that's actually designed to be used with an electronic keyer.

The Vibrokeyer most certainly does NOT need to be of museum quality, & hopefully the price will be reasonable enough that I'll be able to afford presenting it to myself as a gift for Christma

1115. Wanted Johnson Adventurer - Surrite 200ma Meter

Yahoo group: AWAGroup (2010 — 2011)
Date: 2010-11-17 01:43:22 UTC
From: Bruce W1UJR
Topic: 1115 Message: 1115

Hello all!

Working on the 12 year Adventurer project and need a replacement meter.
The factory installed Surrite has an open winding.

I've installed a 300ma meter in its place, but can't really read grid current.
This is a nice clean rig, trying to keep it original, so would like to original
meter to properly fit the hole.

Johnson apparently replaced this meter with a better unit on later
models, but I don't have the specifics.

The unit I have mounts with two screws on the sides and has a gray panel cover.
I can change the scale over, but do need a 200ma unit.

Paying any reasonable price, and most unreasonable ones!

Thanks!

Cordially,
Bruce J. Howes

Eddy -

Yes, from estates and mostly from eBay, especially the rarer ones. Like everything else, sometimes I just go crazy on a given item. At one point it was keys. I still collect keys, but, now concentrate on mainly spark keys and have many early real rare ones (Marconi, Massie, Ducretet, Wireless Specialty, etc.). 73 - Mike

Hi Guys,

Count me out of tonight's QSO Party dress rehearsal, I'm afraid...

I monkeyed with the 3x227 MOPA all afternoon to cure its raspy warbble, and am still not satisfied with the results...so it looks like I'm again going to get on the actual event in December with my 1923-style p-p 203A Colpitts rig.

I even went so far as to jumper the rotor in the VFO portion of the MOPA & achieved a modicum of success...but I'm not happy with the still-raggedness of the tone...

Oh well, more work for some other time---just not right now!

Y'all,

Andy, UU1CC, is looking for a picture of the REL Globe Girdler Cat No 271 transmitter. It was built by Radio Engineering Labs in 1931 and 1932. I copied the picture from Moore's Transmitter Book for him, but it's pretty blurry. There are pictures of the rig in QST as follows: August 1931, page 85; September 1931, page 75 (probably the best picture); October 1931, page 68; November 1931, page 2; December 1931, page 96; February 1932, page 73.

If anyone who has original QSTs could copy one or more of those pictures for Andy, I'm sure he would appreciate it. Also if someone has a real, live Globe Girdler, would you please take some pictures of it and send them to Andy.

His email address is ur3ijc@...<mailto:ur3ijc@gmail.com> . If you look him up at UU1CC or UR3ijc on QRZ.com you will see he has a really neat web page too.

Thanks,

Jim Hanlon, W8KGI

As per Lou's request I just posted photos and schematic of my 1934 transmitter in the photo albums, John_kb7nrn/1934 MOPA.
Some of you have already seen it so please bare with me.

Based on Bill Orr's CQ article from Nov. 1971.
Interesting that the article is 39 years old this month but when writin the subject was only 37 years old.

Had a sked last night with Steve, KK7UV, in Montana. He used his 1929 TNT rig. 599 reports both ways. Very interesting copying a free running oscillator rig. We were at 3580 giving the digi guys heartburn!

Subject: [AWA Group] Need REL Globe Girdler picture

Y'all,

Andy, UU1CC, is looking for a picture of the REL Globe Girdler Cat No 271 transmitter. It was built by Radio Engineering Labs in 1931 and 1932. I copied the picture from Moore's Transmitter Book for him, but it's pretty blurry. There are pictures of the rig in QST as follows: August 1931, page 85; September 1931, page 75 (probably the best picture); October 1931, page 68; November 1931, page 2; December 1931, page 96; February 1932, page 73.

If anyone who has original QSTs could copy one or more of those pictures for Andy, I'm sure he would appreciate it. Also if someone has a real, live Globe Girdler, would you please take some pictures of it and send them to Andy.

His email address is ur3ijc@... . If you look him up at UU1CC or UR3ijc on QRZ.com you will see he has a really neat web page too.

Thanks,

Jim Hanlon, W8KGI

Mike, if you don't have the info, then you can't use the set.

Tell you what, seeing as you are a brother ham, and I'm more than willing to
help a brother ham out,

I will gladly take that useless item off your hands, and even pay the
postage to send it to Maine. :-)

As per Lou's request I just posted photos and schematic of my 1934 transmitter in the photo albums, John_kb7nrn/1934 MOPA.
Some of you have already seen it so please bare with me.

Based on Bill Orr's CQ article from Nov. 1971.
Interesting that the article is 39 years old this month but when writin the subject was only 37 years old.

Had a sked last night with Steve, KK7UV, in Montana. He used his 1929 TNT rig. 599 reports both ways. Very interesting copying a free running oscillator rig. We were at 3580 giving the digi guys heartburn!

Power out is 15-20 watts on 80mtrs and 20-25 watts on 40mtrs.

Looking for BVL 160mtr coil if anyone has a spare...

The only xtal I have for 80mtr CW is 3850. Really is an old color burst xtal in a HC6 holder stuffed inside a vintage round holder.

If any one has a vintage round or square xtal with 1/8" pins spaced 3/4" apart they would be willing to sell please let me know.

I do have plenty of xtals for 160 and 40mtrs though.

Lou,
Any freq on 80mtr CW that will get me out of the digi sigs and where a slow speed cw op can make contacts. Not too particular. Suggestions?

Ya know I haven't been on 80mtr CW since the old novice band days... Still have a 3710 FT-243.

From 1800-1840 are FT-243s that I re-ground. I have adapters to use them in the older xtal sockets.
My early 160mtr xtals are from 1927-1971 kc.

1150. Project Pix on AWA Web Site

Yahoo group: AWAGroup (2010 — 2011)
Date: 2010-11-23 21:10:32 UTC
From: Bill Stewart
Topic: 1150 Message: 1150

Recently I had a request for a picture of my '29 Hartley. Not that it was any trouble, but I had to search my files to find a pix which was a bit out of date and email it to the interested party. So I got to wondering could the AWA sponsor pages on the site for members to post their rig pix (similar to the QRZ.com method). Also other AWA groups could do the same such as the A-K group, tube group, etc...posting pix of their projects and refurbishments. I am thinking that a member could post numerous pictures along with short descriptions. Also,the page(s) could be a central archive of members efforts. It would be simple to direct an interested party to the pix plus they could look over a lot more than just one persons accomplishments. Also rather than have the pictures scattered all over the web, many could be in one central place. I would think that it might also help to increase membership. It would seem to me that this would be a suitable project for the AWA to take on. I am not very knowledgeable in how to set up these types of things but I'm sure someone at AWA Hq. would know how to do it. I guess one of the main concerns would be the 'byte' count.

Any comments on this subject?
Happy Thanksgiving to all.....

First, You need a big server to store it on.

Second, It takes a fair amount of money to support and maintain the server. Wether you own the server or rent the space it still takes money.

The question is, who has deep pockets? The AWA?

Bill,

This Yahoo group can host a considerable amount of images.

Primary consideration is image density. Images that are for display only, 72 dpi is more than adequate. An image size of 640 X 480 pixels will display AND load adequately.

The other convenience is a establishing a photo directory that can be easily searched by individual sub-directories. Each major directory being the location for all that users files.

This group is relatively new so policies can be explored to improve the image service that Yahoo can provide. It is entirely up to the owner (moderators) to manage.

Best!

Chas

So I got to wondering could the AWA sponsorÂ pages on the site for members to post their rig pix (similar to the QRZ.com method). Also other AWA groups could do the same such as the A-K group, tube group, etc...posting pix of their projects and refurbishments. I amÂ thinking that a member could post numerous pictures along withÂ short descriptions. Also,the page(s) could be a central archive of members efforts. It would be simple to direct an interested party to the pix plus they could look over a lot more than just one persons accomplishments. Also rather than have the pictures scattered all over the web, many could be in one central place. I would think that it might also help to increase membership. Â It would seem to me that this would be a suitable project for the AWA to take on. I am not very knowledgeable in how to set up these types of things but I'm sure someone at AWA Hq. would know how to do it. I guess one of the main concerns would be the 'byte' count.Â

1156. Re: [AWA Group] Re: Project Pix on AWA Web Site

Yahoo group: AWAGroup (2010 — 2011)
Date: 2010-11-25 12:48:51 UTC
From: Bill Stewart
Topic: 1150 Message: 1156

Tnx Chas for your explanation. As John mentioned, there would be a need for a big server and some bux...which the AWA may not have for something of this nature. If the Yahoo group could host something of this nature I think it would really be a nice addition to the AWA group. It would sure be convenient to have a lot of member pix at a central location and easy for anyone, not just members, to take a tour and see the many different types of projects AWA folks have made. Another idea might be for the AWA to add to the site a list of up-to-date links to other web sites dealing with AWA member projects. The few there now have been there a while.

Happy Thanksgiving

Hi Scott,

Times a-wastin' here, & the QSO Party starts soon...!

I've checked the AWA home page for a downloadable sample log sheet for the event, but so far have turned-up nothing...am I looking at all the wrong places, or has one for 2010 yet to be posted...?

Looking forward to getting ALL of the details finalized here...

Thanks in advance, with my vy

1159. Arcturus AC 26 in Hartley?

Yahoo group: AWAGroup (2010 — 2011)
Date: 2010-11-30 16:34:06 UTC
From: john_kb7nrn
Topic: 1159 Message: 1159

I have a new Arcturus AC 26 tube I thought would look great in a Hartley. Steve, VE7SL is motivating me to build a transmitter for the Bruce Kelly QSO party. Probobly won't get it done this year but next year it should be ready to go. Sry Steve.

My only concern is how to key the transmitter. The AC 26 uses an indirectly heat cathode that is tied to one leg of the filament.
See http://www.bill01a.com/tubephotos/arct-ac26.htm

Would keying a center tapped filament transformer still work?

Hello Lou and group,
The Hartley is coming along fine. I finally heard it transmit last night on 3.547. Needless to say, I was really excited. I believe my biggest issue will be a consistent power supply. I am using 9 volt batteries for the plate and 2 D cells for the filament. I would like to post a photo for all to see. How do I do that?

Terry,
to post a photo, you can go to this group home page then select "Photos" on the left side bar. You will now be in the Photo Album section where you will see menu selection in the upper right. from there you can create an album and load you photos.

Once photos are loaded, you can direct members to the album.

How to attach a photo to a msg is still a mystery to me.

From: Jeffrey L. Cooper
Topic: 1173 Message: 1177

Guys,

I think we discussed this back at the beginning of the group. Attached images will be passed to those who have selected "Individual Email Delivery" in their profile for the group. Those who select "Daily Digest" will not see them. And the images won't be preserved with the message in the group's messages. I guess this is just the way it works. The best way with Yahoo Groups is to do what was advised previously, that is to go to the group homepage on Yahoo (in our case: http://groups.yahoo.com/group/AWAGroup/), sign in to Yahoo, and go to "Photos" in the left-hand column, and follow the process to create an album.

It is confusing and somewhat non-intuitive especially as it works for immediate delivery but then the images don't persist.

Hope that helps explain it,
Coop, AA1WW

1178. 1929 QSO Party

Yahoo group: AWAGroup (2010 — 2011)
Date: 2010-11-30 21:12:35 UTC
From: Diane and Edward Swynar
Topic: 1178 Message: 1178

Hi Guys,

Well, if all goes according to plan, I'll be active in the QSO Party this year using my (usual) 1923 push-pull 2x203A Colpitts transmitter, a 240' centre-fed inverted "V" dipole (apex at 50'), and my Drake R-4 receiver...

This year, though, for a change of pace I'll be using my two-letter callsign of VE3XZ.

Participation in the first weekend will most likely be severely hampered here by a major personal distraction in the form of the ARRL 160-meter Contest, so the main focus will probably be limited to the "daylight" band of 40-meters...however, the second weekend should be "...all 1929 QSO Party, all the time," Hi Hi.

How about everyone else...? Anyone have anything special up their sleeve(s) to spring onto the deserving during the event...? What about more participation from the west coast...? Or will "VE7-Steve" be the sole recipient again this year of 1929-style pile-ups on his frequency...?!

Here's hoping I can work as many of you guys as I might be able to hear---and then some!

Yes, but your note will probably have some AC because the cathode is
connected to one side of the heater, and thus will have 1/2 the AC
heater voltage applied.

I would think it would be better, and simpler, to simply connect the key
between the common heater/cathode pin and ground/B-.

1184. 80m Antenna for 1929 TNT Transmitter?

Yahoo group: AWAGroup (2010 — 2011)
Date: 2010-11-30 22:05:58 UTC
From: kb3dxr
Topic: 1184 Message: 1184

Despite having an extra class license for over 10 years, I now getting around to installing antennas for the HF bands. As I plan on installing a dedicated 80m wire antenna primarily for my 1929 TNT transmitter, I wondering if it would be best to install a standard 80m dipole, or is there another type that would be better suited to my 1929 transmitter?

Thanks,
Christopher KB3DXR

That's what we like to hear....some of the best signals come from the nastiest-looking rigs it seems!

Hi Christopher,

My first '29 xmtr was the TNT from Dec 1929 QST. It suggested and gave dimensions for a off-center fed Hertz, which is now known as a Windom. I have used this antenna for the past 8 or so years for regular 80 & 40 mtr QSOs (HB and the '29 rigs) and also the '29 QSO party. It works quite well for me. I managed to work K6TQ several years ago running that TNT with a 301A tube at about 4 watts input. Its easy to string up and only requires a single wire feed line. I just tap the feed line to the tank coil on the TNT (thru a cap) and other rigs just a few turns around the tank coil. You can use a pilot lamp in the feed line for power indication (short out for QSOs...could cause chirp).

Good luck with your antenna selection and hope to work you in the QSO party.

Chris - Great stuff! ... many of the '29ers are using dipoles or inverted V's with good success. Try and get it as high as possible of course and pull-er up tight so it doesn't sway much if the wind comes up. Look forward to working you on both 80 and 40 if condx are as good as they were during last year's affar.

1190. '29 Bruce Kelley 40m Strategy?

Yahoo group: AWAGroup (2010 — 2011)
Date: 2010-12-01 02:22:12 UTC
From: ve7sl@shaw.ca
Topic: 1178 Message: 1190

Well last year I reasoned that since the contest began at 1500 local time out west, that I would spend the first few hours on 40m. However it seems that, since the contest begins in darkness for everyone else, most start up on 80m and keep going for the night. I did work one station during my early time slot however. The second weekend worked a little better, with four eastern stations worked on 40m between 1500 and 1600 local time back here.

It might seem a good plan, for the easterners and the midwestern stations to spend the first hour at least, on 40m, before moving to 80, if it is a convenient 'switch-over'. I realize that nobody wants to spend an hour setting up and tearing down, just to switch bands.

This year I will have two transmitters...the TNT will be run on 40m for the first couple of hours and then I'll switch out to the Hull Hartley on 80m for the remainder of the night. Perhaps there is an east coast 'early morning' strategy for 40m that I am not aware of?

I know that there are more rigs capable of 80m than 40m operations and that may be one reason for the lack of 40m activity, but making trans-con QSO's up on 40 is a lot easier than on 80!

I'm running a bit late with getting this up on the website. The pdf is here:

http://www.antiquewireless.org/pdf/kelley_rules_log2010.pdf

I'll be on both weekends. I have the 210 push pull Colpitts running pretty good on 80m, pretty squirrely on 40m. I'm thinking that my next transmitter design should not include any fixed capacitors in the tank. Darn old 70 year old caps.. hi hi

Terry, that's probably not the exact way to do it but close. I haven't tried it myself, but there is usually a op or two who does run AC on the plate either thru an unfiltered power supply or from a Ford spark coil. You will recognize them by the buzzzzz. If you have access to the QST archive, you might be able to search that for the best hook up scheme. Also, I'm sure a list member would be able to steer you (and me too) straight. I would like to run a '20s rig like that in a future QSO party.

Anyone want to give us the particulars on running RAC? Or any other quick power supply so Terry can have more juice than the 9V batteries.

Thanks, Bill

Bill, Terry, et al,
One way to run raw AC on the plates is to use an isolation transformer, 120v in 120v out. This will reduce the arc fault current that you get from a 15-20 amp house hold circuit. I have one or two little 50VA isolation transformer kicking around here. Something like that should work just fine for a little one tube TX.

Also, you can take two fialment transformers and put them back to back, providing they have the same primary & secondary voltage. It would go like this. 120v in 1st transformer, 6.3v out, connect this to the 6.3v winding of the 2nd transformer. Now the 2nd transformer will have 120v out on the primary. It will work with 12v or 24v doorbell transformers the same way, remember to use the same voltage rated transformers for both, don't mix and match voltages.

John

Guys...I know that we love the musical notes of '29 style rigs and antennas swaying in the wind...but is RAC really a path we want to go down? Didn't they make RAC illegal sometime around '31 ?

Hi Gang,

I agree with Steve---putting a signal on the air (even a QRP one!) with raw a.c. on the plates is one surefire way to attract a LOT of the wrong kind of attention to this niche of Ham radio, and the players therein...

I can recall when Bob (W2ZM) used to fire-up his "self-rectified" rig in past such events: even with low power, you couldn't operate anywhere even close to his frequency!

Some technology is perhaps best left in the history books, & not on the air... Hi Hi

Date: 2010-12-01 21:40:53 UTC
From: Niel - W0VLZ
Topic: 1206 Message: 1206

I plan to be on 3565 tonight around 8PM CST trying out my Hartley with a couple different antennas. Anyone else?

Right now I'm not certain my 80 mtr top loaded vertical (see http://w0vlz.blogspot.com/) will work for the '29 contest. Part of the loading is the top 6' of two of the guys. Any sway at all and a guy sags a little shifting the load my Hartley sees enough to FM/wobble my signal...distracting to say to least. I may have to reserve it for really late night QSOs. It should work fine, though, for the LC in January.

73,
Niel - W0VLZ

Great Larry! - I will certainly be listening hard on 40m for the first two hours at least so appreciate you being there. The band seems really good to the east at that time lately but shortly after our sunset seems to go into the tank as the prop has been going more 'polar' than e-w. I hope things change between now and Saturday as condx have not been all that good the past few nights although they have been slowly improving. Even better news is our local wx forecast calling for cold clear skies which hopefully means NO WIND!

1214. TNT Joys!

Yahoo group: AWAGroup (2010 — 2011)
Date: 2010-12-02 22:32:23 UTC
From: ve7sl@shaw.ca
Topic: 1178 Message: 1214

I've spent a few hours setting up the TNT for exclusive 40m use and, not being happy with the raspier than usual note, put a 100 ohm pot across the onboard center-tapped filament resistor allowing me to tune-out the hum...it worked amazingly well and the note sounds very T9 now, except for the 1 kc drift during a typical 3 or 4 minute transmission.

Following the mods I called CQ on 7045 and was answered by Jay, VY1JA up in Whitehorse who made my day! Looking forward to working as many as possible on 40m during the first two hours of the '29 QSO Party, before moving down to 80 with the Hull Hartley. Prop seems to be shaping up nicely ...I hope the same for the wind.

Interesting Neil...the 80m ones are from the Hull Hartley as that is the only thing I have put on the air before firing-up the TNT on 40 today.

I wish I understood how to use this thing or how it works.

Skimmers are set to recognize any CQ (not "AWA", sorry) and report call, frequency and signal strength in real time.

Works great for comparing two antennas. Just remember to shift frequency a couple of KC when switching antennas. Also can tell you if the band really is open or not. Your signal does have to be stable, though.

It sure is Jerry, don't think I've seen anything like it. Seems like I saw a post either here or on the Boatanchor list that W9EVT lost most of his antennas and towers during a recent storm.

Tnx for the report. I was running a DX-35/SX-100/Inv.V. The other stn in the QSO was N4QR running a 3 tube HB w/6L6G final, 20w...

From: ve7sl@shaw.ca
Topic: 1206 Message: 1223

For those stations planning on working 40m for the first hour of the QSO Party (40 is excellent at that hour and up until at least 0100Z) there is presently a large RTTY contest underway really messing up the CW segment suggested for our AWA activity. Thankfully the contest ends one hour after ours QSO Party begins so we might have more luck moving up to the 7105-7015 segment which is always much quieter. ...at least for the first hour.

Steve / VE7SL

1224. Reminder of the AWA 1929 QSO Party

Yahoo group: AWAGroup (2010 — 2011)
Date: 2010-12-04 04:17:51 UTC
From: whitebear1122@comcast.net
Topic: 1206 Message: 1224

It's that time of the year again when 40m and 80m static finally quiets enough to let us hear those beautiful warbles and chirps from our 1929 radios. While I know some of the guys use their 1929 gear all year long, most of us will be dusting the rigs off and setting them up for the December run. Here is the information for the upcoming 1929 QSO Party. I hope to hear and work each and every one of you 29 guys. Logsheets and rules are up on the AWA website now. 73, Scott WA9WFA

The 2010 Bruce Kelley 1929 QSO Party

The Bruce Kelly 1929 QSO Party is a yearly AWA sponsored event where amateurs build their own transmitters using the designs, techniques, and tubes that were available in 1929 and earlier, and then put those classic transmitters on the air and try to contact as many other 1929 stations as possible. Since they use early designs, it is a cancatny of whooping, chirping, buzzing, clicking, drifting, swishing, swaying, worbling, and other interesting signals. This is what ham radio sounded like in 1929. Even if you’re not an amateur radio operator or don’t participate in the QSO Party, you may enjoy listening for the event and hearing those signals for yourself. The 1929 QSO Party was started and championed for many years by Bruce Kelly W2ICE, an AWA founder. Prior to Bruce’s passing, he asked his close friend John Rollins W1FPZ to keep the 29 QSO Party going. John Rollins championed the QSO party for many years and renamed it the Bruce Kelly 1929 QSO Party in honor of Bruce. A few years back John Rollins asked me to take over the 29 QSO Party and keep it going. Bruce Kelly and John Rollins are now Silent Keys and I know both John and Bruce will be with us in spirit.

Dates and Times: First two weekends of December, Saturday Dec 4 through Sunday Dec 5, and Saturday Dec 11 through Sunday Dec 12. Starts at 2300Z (6:00 PM EST) Saturday night and finishes at 2300Z (6:00 PM EST) Sunday night, both weekends.

Objective: Contact as many 1929 stations as possible. Contact exchange consists of RST, Name, QTH (State such as ME or MN or NY), last two digits of the year of the transmitters design or publication (such as 29 or 27 or 23), type of transmitter (such as TNT or TGTP or MOPA or COLPITTS), and power input (such as 6W or 9W).

Rules: Transmitters must be 1929 or earlier types of self oscillators such as the Hartley, TNT, PP tuned grid tuned plate, MOPA, Colpitts, etc. No crystal oscillators. Tubes must have been available during or before 1929. Individual stations can be worked only once on 80 meters and once on 40 meters over the course of two weekends. Contacts count for scoring if made with another 1929 or earlier station. Note this rule change: contacts made with non-AWA visitors with modern equipment who are seeking information about the event may be counted. Log a modern contact with "MOD" or "modern" on the TX column. You can use any vintage or modern receiver that you wish. The event is open to all amateurs operating 1929 style transmitters.

Input Power: Transmitters are limited to a power INPUT of 10 watts or less. However, to help make East-West contacts, power may be increased to 20 watts INPUT between the hours of 0500Z (12 Midnight EST) and 1300Z (8 AM EST). Note this is INPUT power. Power input is

calculated by multiplying PA plate voltage x total PA plate current. Example: my plate voltage is 300 volts dc, and my plate current is 30 ma, so my total input power is 300 x 0.030 = 9 watts input.

Frequencies: The QSO Party operates in both the 80 meter and 40 meter cw bands. The QSO Party typically operates between 3550 to 3580 Kcs and 7040 to 7060 Kcs, plus or minus depending on QRM, cw nets, and RTTY contests.

Logs: Either electronically email your 1929 log to Scott at wa9wfa@... or via post office mail to: Scott Freeberg WA9WFA, 327 Wildwood Avenue, White Bear Lake MN 55110. Logs must be in the 1929 QSO Party log format otherwise it will be difficult to score you. An official 1929 log sheet will be available for download from the AWA website. For an SASE I will mail you a paper log sheet, and you can I email me for a WORD logsheet.

Scoring: Scoring is simple. Add up the number of QSO’s on 40 meters and 80 meters. Example: if I make 15 QSO’s on 80 meters, and 10 QSO’s on 40 meters, my final score is 25. All submitted AWA logs will be scored and displayed in the results. Please submit logs by January 15, 2011.

Good luck to all participants! Please send me a photo of your 1929 station. Thanks. 73, Scott WA9WFA

1234. Sorry I'm Late...!!!

Yahoo group: AWAGroup (2010 — 2011)
Date: 2010-12-05 19:16:47 UTC
From: Diane and Edward Swynar
Topic: 1234 Message: 1234

Hi Guys,

My sincere apologies for being so tardy getting on here...

I'm spent from all the racket in the ARRL 160-Meter affair, & my son & his wife dropped-in for a spell...well, the whole gang---son, daughter-in-law, daughter, & XYL---have left the premises to do some shopping, so I headed right down to the 1929 station...

NO OT SIGS HEARD AT ALL on 40-meters, so I just tuned-up on 80-meters---and again, nothing heard. I'm hoping for at least a couple of contacts before 6:00 PM here...maybe 80 isn't open yet, but why so quiet, activity-wise, on 40...?

Oh well, I'm heading back down in about 15 minutes, or so...

~73!~ de Eddy VE3XZ

1235. 1929 QSO Party: Status

Yahoo group: AWAGroup (2010 — 2011)
Date: 2010-12-06 13:53:13 UTC
From: Diane and Edward Swynar
Topic: 1235 Message: 1235

Good Day All,

Well, because of the ARRL Topband "clickfest"(!), I sure was late getting to the Party yesterday evening, but still managed to snag 9 QSOs before the 6:00 PM closure---including one with stalwart organizer & empressario(!) Scott, WA9WFA...!!! (BTW, your Colpitts sounds a LOT more stable than my own does here---FB).

The nice thing about my oh-so-brief participation was the fact that more than half of the stations I worked were---to me, at any rate---newcomers to the event. That certainly bodes well for the future of things...

Next weekend should see no distractions, radio-wise anyway, preventing me from upping the ante here in terms of adding more stations into the log. See y'all then...!

~73~ de Eddy VE3CUI - VE3XZ

1237. 1929 QSO Party Observations

Yahoo group: AWAGroup (2010 — 2011)
Date: 2010-12-06 19:58:52 UTC
From: whitebear1122@comcast.net
Topic: 1234 Message: 1237

I had the nearly all of the weekend reserved for the 1929 QSO Party, only missing the first hour of the event when running to get Chinese carryout at the request of my wife and daughter just as the event was starting. hi hi I had the woodstove stoked up and the basement shack nice and toasty as it was bitterly cold and snowy outside.

I better post my comments on the the first weekend results before I forget or confuse them with 2nd weekend comments.

1. Heard several new callsigns working the event, maybe heard/worked 4 or 5 new guys. Great! I think it's important to 'grow 1929 stations' by talking up the 1929 transmitters and encouraging new people to try it out. One Mid west station, KB0ROB, is instrumental in getting many midwestern stations on the air through motivation, talking it up, supplying parts, advice, etc.

2. 40 meters rocked Sunday afternoon with more stations working 40m than I heard in the past. 80m is dead early Sunday afternoons so I wish more of the gang would move to 40m!

3. The universe is in balance as I heard KB0ROB and WA3FFC calling AWA in the wee hours of the night. It used to be W2ZM, KB0ROB, and WA3FFC in past years. I generally use FFC as my East Coast propagation indicator.

4. Thank goodness for a large mid-west contingent because our East Coast friends were hard to hear. I worked a couple guys out east but propagation wasn't good at my place anyway.

5. I was pleased to work some western stations including VE7SL, KK7UV (I don't quite remember the call), and K4JYS in NM. I heard someone else mentioning working Bud W7LNG but I didn't hear him. I've heard there are other West Coasters in the event too. Who from the west coast is participating?

6. Saturday night 80 was abuzz with signals, maybe more than I've heard before at one time. I wasn't bothered by any RTTY qrm for once. And once the cw nets conclude, the band was pretty much ours. I picked up a few more stations Sunday morning on 80m, more of the midwest guys, no East Coast.

7. It was interesting to note changes in propagation over time. Saturday night I picked up some of the local guys and a half hour later they simply disappeared as the band went long and I never heard them again that night. Sunday morning I worked some more and the band dropped out around 10 AM. Around 3:30 80m started waking up again. The locals were screaming in louder than ever. Around 4:30 I actually heard some East Coasters coming through for about 15 minutes before that propagation "channelling" disappeared. I heard NE1S and W1GIG, I called several times but no luck.

8. I did work all the Canucks at least once including VE7SL, VE3AWA, and the elusive VE3XZ so I guess I've "Worked All VE". Are there other Canadian stations that I need to seek out?

9. I had a couple of guys QSO me to ask what was going on. One guy surprised me because he came back to my "AWA AWA AWA de WA9WFA" call with a signal that was mighty 1929. When he didn't give me a report I quizzed him about the event, no he wasn't in the event but was just curious about it. I didn't ask him why his signal sounded so awful :) an unstable signal sounds great on a 1929 rig, sounds like crap on a rice box... har har

10. Heard lots of wonderfully 1929 signals. I'm trying to remember who was the buzzsaw this year. I think N8YE was the one with the raw ac sounding signal. Heard lots of wind modulated signals which in my opinion is one of the most beautiful sounding 1929 signals. Heard alot of chirpers, some slightly chirpy, some extra chirpy. Heard one 29 station that sounded more like two signals together. It's hard to explain but I didn't hear just one tone, but two tones separated by maybe 100-150 hz. It was cool.

11. For you guys that worked me, what did my push pull Colpitts sound like on 80m and 40m? While I can never be sure of my own signal since the receiver is 2' away from the transmitter, it did sound like I had some wind modulation on my signal. Plus it sounds like my frequency is jumping abruptly a bit on 40m. I set the frequency counter nearby to look for that jumping behavior.

12. I was running the 210 push-pull Colpitts duo banded for 80m and 40m. 40m was a little less stable than 80m but it seemed ok at least on my end.

13. One observation: I heard alot of guys using MOPA's this year. Some of the MOPA's were plenty chirpy too. I've come to the conclusion that single stage transmitters can be made to run an incredibly stable signal, and MOPA's can be made to run chirpy and unstable.

14. One of the more beautiful albeit somehwat chirpy signals was W0CWU's MOPA.

I saw Eddy's comments that he'll be back next Saturday night in full force. Good. I need to pick him up on both bands. Ditto for VE3AWA and VE7SL as well.

Gads what a grand time the 1929 QSO Party is!! I was a pleasure working all of you!

73, Scott WA9WFA

I was on 40M Saturday morning for a while, but had to quit around
11:30AM local and when I started back up around 3:30PM, I went back to
80M as I heard no AWA signals on 40M then. Sounds like I missed out on
some of the best time to be on 40M, drat.

Sorry Scott; I didn't hear you calling and would have loved to work you!
QRN on 80M was wicked here. If it makes you feel any better, I tried
unsuccessfully to raise W1GIG as well.
>

?? This last statement conflicts with observation #8.

I worked Eddy (VE3XZ, not to be confused with VE3CUI) on 80M, VE7SL on
40M, and VE3AWA on both bands.

73, Scott, and hoping to work you on both bands next weekend!

-Larry/NE1S

1239. Re: [AWA Group] 1929 QSO Party Observations

Yahoo group: AWAGroup (2010 — 2011)
Date: 2010-12-06 22:02:55 UTC
From: ve7sl@shaw.ca
Topic: 1234 Message: 1239

Scott - it was great to read your summary as well as Larry's. Hopefully others will post their thoughts and observations as well.

I started out on 40m (it is still an hour before sunset out west when the Party begins) and managed just three QSO's but working Larry, NE1S, was very gratifying. I am truly impressed with the operating skills of all of the '29 participants as they seem to be able to copy the feeblest of signals and never ask for repeats! With the RTTY contest in full-swing for the first hour of our affair, the normal suggested operating frequencies for 40m are pretty much useless and all three of my contatcs were up in the little-used and much friendlier 7.120 region...the old Novice band. Perhaps we should seriously look at making this the suggested 40m 'watering hole' for future '29 Parties?

Off to 80m after the first hour and after waiting for the sun to go down, things started to come to life. Overall I found condx to be good but not quite as good as last year's superb propagation. As usual, the wind started to pick up right at contest time but I had added another tie-down to my 40 and 80m wire verticals and they were both stretched as tight as a banjo string. I built this last year in case of wind and it saved the day for me. It consists of some homebrew 4" ladder line made from dollar-store plastic coathangers and four ground radials for each band.
The top end was shot up to the top of a 75' Fir using my antenna-wire spud gun.

http://members.shaw.ca/ve7sl/verticals

After a few hours, the wind abated and things got back to normal. I heard several 'windy' signals during the contest as well. It was great to work some new blood or at least guys that I did not work last year. Absent (at least I didn't hear them) were N9OO, W0LS, W0CWU, W0NYQ, WU2D, N9CQX, W3GMS, N4GJV, K0PK,WA9QNN, W2AO and W1TSP. My apologies if they were on the air and just 'not heard' back here. Heard but not worked were: W8KGI (on 40m), W2CQH, W1GIG, W1ZB, K1GDH, K8MB, WB2QMY (he QSL'd my report but I couldn't pull him through...2 watts input) and AG2M....maybe next weeekend??

Best DX of the affair for me was working VE3AWA,WA3FFC, K4JYS, WA1JAS, W2LB (5W!), K1TMJ, W3FJJ on 80m plus the big crowd from MN...must be something in the
water there that breeds '29 activity?

Of my 22 QSO's, fully 7 were using Hartleys, 7 using MOPAs and 3 were using TNTs...with the remainder using TPTG's or Colpitts oscillators. For the first few hours, whenever I heard N8YE, his tone was pure a.c. and virtually impossible to copy at the strength of his signal. He must have done some tweaking as when we worked later in the evening, he actually had some tone

to his note, making copy much easier.

Some of the signals were exceptionally strong, given the power being used. WA1JAS (8W) actually peaked to S7 on the S-meter during our QSO and Scott, WA9WFA,
was over S9 briefly, just around his sunrise time. It really is amazing what a little
favorable propagation will do with a miniscule amount of RF on 80m.

I hope to spend a little more time on 40m next weekend at the start....but where will the activity be...
7050 or 7.110 ? I see there are two digital contests messing-up our 40m window again next
weekend but unlike last week, these ones will not stop after the first hour. I would suggest everyone look up in the 7.110-7.120 region for starters.

>and WA3FFC in past years. I generally use FFC as my East Coast propagation
>indicator.

he must have a great antenna as he was the east-coast beacon signal here all night long.

>I've heard there are
other West Coasters in the event too. Who from the west coast is participating?

You have most of them...KK7UV (MT), myself, W7LNG (OR). I heard that W7DRA (WA) was on with a pair of 211's but I didn't hear him at all. I think he was way down at the low end and not tuning high enough to find the AWA activity. He will correct this for next weekend apparently...his Command set rx's are difficult to tune as well. Also, W7OIL (WA) will hopefully be on with his delightful 'Double-M', a unity-coupled come TNT at around 2 watts.

>Are there other Canadian
stations that I need to seek out?

you got all of them....WAVE award is on the way :-)

>Heard one 29 station that sounded more
like two signals together. It's hard to explain but I didn't hear just one tone, but two tones separated by maybe 100-150 hz. It was cool.

this is exactly the way I described KK7UV's note to him...was it him by chance?

> For you guys that worked me, what did my push pull Colpitts sound like on 80m and 40m?

it sounded great once it decided what frequency it wanted to settle on....when you called me, it jumped from my frequency, up 2 kHz and stayed there for the remainder...and you were darn loud. I heard you again about 20 minutes later and your signal was barely copyable...after sunrise perhaps?

Note that VE3XZ=VE3CUI in case anyone thought that they missed Eddy.

>Gads what a grand time the 1929 QSO Party is!! I was a pleasure working all of you!

I agree...too bad it's just once a year ...hhhmmmm ;-)

Hi Gang,

Yeah, I have no doubt but that I interspersed my VE3CUI callsign in there a few times, when I should have sent VE3XZ...! Hi Hi

Contesting friends here tell me that I should use the 'XZ moniker ALL of the time, because of its brevity & "swing" on CW. In as much as I like VE3XZ, my very first callsign was VE3CUI, and I'll probably never give it up, if only for that reason.

Gee, but you guys have really & truly done yourselves proud in the first edition of the QSO Party! I can see that I have a LOT of catching-up to do next weekend. I'm up to the task, as long as I don't have any "...local QRM" here to distract me, if you know what I mean...

As I mentioned before (to Scott...?), it takes time to adjust from running up to four QSOs per minute in the ARRL 160-meter contest, to running FOUR MINUTES per QSO in the Kelley affair! Hi Hi

Is it any wonder I get confused & send out the wrong callsign by times...?! :>)

Stay warm, wherever you are---it's in the VERY low 20's F here, & with the windchill factor it's positively Arctic-like. But we're getting a break on Friday---supposed to be a balmy 35F then!

~73~ de Eddy VE3CUI - VE3XZ

Hello,

Some of us have been riding along with Dan, W7OIL while he finished building a, it is assumed, little known transmitter circuit called the Double-M.
(See Group Files "Unity Coupled" for the ARRL Handbook version of this circuit)

For the full story and an opportunity to download the original 1935 Modern Mechanics magazine article please go to:

http://www.w7oil.com/Double-M.htm

Dan, we hope to hear & work the Double-M this Saturday evening.

73, Lou VE3AWA

The OM must be a QRO Op. See power panel in background.

Hi Lou,

Thanks for the link to W7OIL's version of the Double-M. I've had that 1935 Modern Mechanics in my file for several years now and also planned to build one. It would be interesting to hear Dan's experiences with this transmitter. The though of the very tightly couple grid coil inside the plate coil was a real insightful design by the original creator. If you wanted to cheat a little I suppose you could use some small diameter hardline coax as the coil which would save you from having to feed a tightly fitting wire into some 1/4" copper tubing.

73

Don N9OO

BTW gang, due to some business travel I won't be in this years 29 QSO Party. While my dear XYL is suffering through the very cold WX in Wisconsin I'm here in San Diego this week where it is in the mid-60's during the day. Oh woe is me, hi.

1244. Hartley update

Yahoo group: AWAGroup (2010 — 2011)
Date: 2010-12-08 13:27:27 UTC
From: Terry Hall
Topic: 1244 Message: 1244

Just a quick note to update the group on the Hartley. I have installed a more permanent antenna coil and will work on a filament supply this week.

I will have my 40 meter QRP rig at my home in North Texas this weekend, so perhaps I will work some of you during the QSO party.

On the down side, my TS-520, which is the only 80 meter receiver that I have, is on the blink. It looks like I will have to send it for repair after the holidays.

All the best, Terry KE5YUM

1245. 845 in a Hartley?

Yahoo group: AWAGroup (2010 — 2011)
Date: 2010-12-08 22:04:48 UTC
From: john_kb7nrn
Topic: 1245 Message: 1245

I've seen 211's and 203's in vintage hartley circuits but how would an 845 work?

I ask because I don't have any of the tubes just mentioned but was given an 845 at a swapmeet in Oct. with the stipulations that, 1. I couldn't sell it and 2. I had to build something with it. So going on the success of the little Arcturus Hartley, I thought I'd venture to something a bit bigger.

From what I've been able to learn about the 845 is that it's like a low mu version of the 211. That might not be exactly correct but the operating perameters are very close except for the gain.

For use in a Hartley TX what would be a good plate voltge to use to make it comply with the 1929 QSO Party?

Any other hint's, tips or cautions you all might have would be appreciated.

Does anyone know what a 12FQ8 is good for? I inherited a couple and can't find any circuit to use them in. I think they were used as complex tone generators in Wurlitzer organs, but even that's sketchy.

Leonard

Thanks for the link to W7OIL's version of the Double-M. I've had that 1935 Modern Mechanics in my file for several years now and also planned to build one. Maybe there'll be a flurry of MM builds after the Party?

If you wanted to cheat a little I suppose you could use some small diameter hardline coax as the coil which would save you from having to feed a tightly fitting wire into some 1/4" copper tubing. Cleaver Don....

BTW gang, due to some business travel I won't be in this years 29 QSO Party. :0(

73 Don and stay cool, Lou VE3AWA

Steve,
I called CQ from 0100-0200z tonight. Was bouncing around 3560-3570 trying to find a hole. Also dealing with the backlash in the dial made it tricky.

Finally got a weak responce from KE7DZ in Seabeck, WA. We fought the QRM. I think he's running QRP too.

Anyway, just as I got his call and began to respond, the xyl came out to say it was dinner time. I told KE7DZ I had to QRT for the feed bag.

Was out of there by 0215z so probably missed you altogether.

Lets try tomorrow at 0130z, 5:30 pm PST.

On the 845; Was that the 1929 ARRL Handbook that had it listed?

Hi Steve,
If you look on page 38 of the September, 1932 issue of QST you will find the date of November, 1929 listed for the 845. The date listed has a notation explaining that that is the date for the publishing of data in QST. I hope this will of some use to you. It's just a
guess on my part but I think George Grammer (W1DF,SK) probably compiled the list.

John - I hope he is right as well as it would make a swell project. I have seen one reference indicating that it was released in '31 and I don't recall seeing it on any of the 'eligible tube' lists but as someone suggested, better get the experts to weigh-in on this one.

Anyone else want to chime in on this?

I'll email N6JV to find his reference on the 845.

BUT, if it's in the 1929 ARRL Handbook, it seems there's two references to it, then I would hazard to guess the tube came out in 1928. Otherwise how would the editors at the ARRL know about it? Rarely would a tube be published in the Handbook the same year it came out. Especially in those the early years.

Wikipedia lists the tube as coming out in 1932 or there abouts, looks like you can't trust everything on Wiki can you?

Interesting news, at least to me. I gave the link to
http://home.comcast.net/~n6jv/845.html which has the 845 tube dated at 1928.

The interesting thing is N6JV is the Vice Presidnt on the Tube Collectors Assoc.
http://www.tubecollectors.org/ You think he might know what he's talking about?

As you can see if you go to the link above, Ludwell Sibley, KB2EVN
is the President. I also sent an email to Ludwell about this question.

I'm confident that the 845 will qualify for the 1929 QSO party.

Topic: 1272 Message: 1272

Gentlemen,

Not to put to fine a point on the issue but I looked up the 845 and 849 in the 1938 RCA Air-Cooled Transmitting Tube manual (TT-3). I am intrigued by old tubes being the reason. I have constructed a PA stage for my vintage TX using an 860.

The 845 would be a poor candidate for RF service as it's primary purpose was as an AF tube rated at 75 watts in class A or a pair at 150 watts in class AB. The much more imposing 849 was indeed developed for RF service. It has huge input capacities and is listed as having an upper frequency limit of only 3 Mcs. Ouch!

I renew my offer to provide the 3 JPEGs, that cover the 1932 QST tube table, to anyone who asks.

OK, here's part of the email from Norm, N6JV on the 845 intro date:

"According to "Tube Lore", the number was issued in 4-27. It doesn't appear in the 1927 ARRL Handbook, but it is listed in the 1929 HB so a 1928 production is likely. They were used in early Navy SONAR equipment as SE-3945..... The Handbook info is solid proof for the AWA QSO party rules."

So that settles that!

Now gathering parts for the build!

Oh, BTW, Frank Jones lists the 845 full rating is good up to 10 mhz in his 1932 handbook. Good enought for 80, 40 and maybe 30 mtrs.

Date: 2010-12-09 22:10:47 UTC
From: JAMES HANLON
Topic: 1275 Message: 1275

QST, November 1929, beginning on page 24, has an article by James J. Lamb titled, "The UV-845."

The first paragraph of the article starts as follows. "The UV-845 is another member of the 50-watt type tube group of which the UV-203A and UV-211 are the better known, and has as its special purpose utility as an audio frequency power output amplifier and modulator. While it may be used as an oscillator or radio-frequency power amplifier, it has no advantage over the other 50-watt type tubes in such service and has a serious handicap in its extremely low plate impedance. It is therefore not recommended for radio-frequency operation. ..."

My 1931 ARRL Handbook lists the 845 among other tubes in a single-page table of Receiving and Transmitting Tubes on page 88. In the "Use" column it is listed as an "Audio-frequency output amplifier" and as a "Plate (Heising) audio-frequency modulator." Under those conditions, presumably as a class A amplifier, it is rated for 1000 volts on the plate, plate current of 75 ma, and grid bias of -150 volts. The filament takes 10 volts at 3.25 amps. Mu is 5, plate resistance is 2100 ohms, and mutual conductance is 2000 micromhos. In contrast, a 211 in class A is rated at 1000 volts, 72 ma, grid bias of -55 volts, with a mu of 12, Rp of 3400 ohms, and Gm of 3530.

So it should count as a 1929 tube, but it may not be the easiest to put into service in RF transmitter service.

Good information, Jim.

But the type 245 only has a mu of 3.5, and it is being successfully used in 1929 rigs, including here at ARS NE1S. The plate resistance of the 845 is listed in the 1700 -2100 ohm range, and for the 245 the 1650-1700 ohm range, both for class A amplifier service. Lower mu in an oscillator just means it will require more feedback. And the 2A3, with a mu of 4.2 and plate resistance of 800 ohms, was employed in a Frank Jones exciter design as a frequency multiplier.

So, while it may not be the best choice in 1929, I wouldn't bet against using it successfully in BK 1929 whoopdiwhoop service.
(Just try to build a stable RF amplifier using the 845; no doubt it will take off and oscillate FB!) ;-)

Also, for reference, the '10 has a mu of 8 and plate resistance of 5000 - 6000 ohms (class A amp).

So much todo over a tube but then that is the mark of a good discussion. I remember in ET school ,in the Navy they taught us "If you want an oscillator build an amplifier, if you want an amplifier build an oscillator."

It was over 50 years ago at Great Lakes NTC but the ditty of the day was:

Dual Diode, Hi-Mu Triode....Oscillator, Oscillator....Rah Rah Rah!

This email has no scientific bearing on the 845, IMHO.

QST, November 1929, beginning on page 24, has an article by James J. Lamb titled, "The UV-845."

The first paragraph of the article starts as follows. "The UV-845 is another member of the 50-watt type tube group of which the UV-203A and UV-211 are the better known, and has as its special purpose utility as an audio frequency power output amplifier and modulator. While it may be used as an oscillator or radio-frequency power amplifier, it has no advantage over the other 50-watt type tubes in such service and has a serious handicap in its extremely low plate impedance. It is therefore not recommended for radio-frequency operation. ..."

My 1931 ARRL Handbook lists the 845 among other tubes in a single-page table of Receiving and Transmitting Tubes on page 88. In the "Use" column it is listed as an "Audio-frequency output amplifier" and as a "Plate (Heising) audio-frequency modulator." Under those conditions, presumably as a class A amplifier, it is rated for 1000 volts on the plate, plate current of 75 ma, and grid bias of -150 volts. The filament takes 10 volts at 3.25 amps. Mu is 5, plate resistance is 2100 ohms, and mutual conductance is 2000 micromhos. In contrast, a 211 in class A is rated at 1000 volts, 72 ma, grid bias of -55 volts, with a mu of 12, Rp of 3400 ohms, and Gm of 3530.

So it should count as a 1929 tube, but it may not be the easiest to put into service in RF transmitter service.

Jim Hanlon, W8KGI
Good information, Jim.

Hello group,

Just a short note to update you on my progress. I have built a better antenna coupler, and that seems to work ok. I will have a better idea how things work once I get my filament power sorted out. Last night I pounded some CQs on 3.562 +/-, and the rig sounded good.

I have a G5RV up 30 feet, so I should be able to make contacts soon. I will have some new photos posted next week.

All the best.
Terry

Larry,
Good point.

I knew some low mu triodes were used in transmitter service and wonderd what's the difference.

Ludwell Sibley mentioned the 845 will work just fine in a Hartely designd for a 203 or 211.

Hi Guys,

Well, I got on & was thrilled to work some notable "DX" in the '29 QSO Party, in the form of British Columbia (thanks Steve!), Oklahoma, & Montana...and all on 80-meters, too!

Unfortunately, I'm only just now learning the detrimental impact that rain/freezing rain/sleet has upon tuned, balanced-line fed antennas, and by consequence, self-excited unbuffered osciallator-transmitters---it causes the signal to drift!

My apologies to all who had to endure copying me with one hand on their receiver tuning tuning dials---I agree, the drift was awful.

We've never ever had weather quite like this before in the 1929 QSO Party here: snow yes, wind yes, but this mixed precipitation, NEVER.

I don't know that I'll be back on for the balance of the Party, or not: I imagine the weather effects would only be compunded on 40-meters. Oh well, it was fun while it lasted, & I'm grateful for the contacts that I made---even more so, since a whole whack of my log entries were first-time-ever QSOs with same in this event...and that's certainly good news!

Hi people:

Fair results with the Double-M transmitter. I worked NZ7T near Tacoma right after the contest started. Later in the evening I worked Steve, KK7UV in Missoula, MT and then Burt, KB0MM in Minnesota. Yes, the "MM" transmitter worked "MM". Weird, huh? I saw Steve's signal swinging all over the place as the storm he was having was having fun with his antenna. It was interesting to watch on the spectral display. 8^)

My 2 cents,
I can remember my days in the Navy where we could tell which ships in the squadron were using their old TBL (WW2) transmitters. When the ships rode the swells the QRG would change slightly because of the LW antennas we used and because the motor/generators would change speed slightly. Who needs voltage regulation?

1289. 1929 QSO Party: EPILOGUE

Yahoo group: AWAGroup (2010 — 2011)
Date: 2010-12-13 18:04:34 UTC
From: Diane and Edward Swynar
Topic: 1289 Message: 1289

Hi Guys,

Well, after all is said & done, I ended-up with only 20 QSOs here in my log, all on 80-meters...

I wish I could have spent more time with everyone yesterday, but that precipitation mix here really played havoc with the signal from my Colpitts: the stability would be reasonable for about the first 2 minutes of my transmissions, but then it would drift upwards at an absolutely alarming rate...

I attributed it to the sleet / rain impacting my twin lead feeder to the dipole---but who knows with these OT rigs...? Suffice it to say that I'd never experienced anything quite like this effect before.

Anyway, the weather persisted here all through the day & evening, so I closed down operations.

The good news...? Almost HALF of the QSOs I made were with participants whose callsigns were new to me! And they were NOT "moderns", either! And 20 QSOs is still better than none. What a thrill to work Steve (VE7SL) again, along with newbies (to me, at any rate) in Montana & Oklahoma...!

It was fun while it lasted, short as it was...

Yes, I was definitely jumping frequency 1Kc or so - I heard it in my receiver. I think it was due to the contact between the battery clips on the feedline to the feedthru insulators on the house, as the wind was picking up due to the storm. In fact, the wind was howling so much overnight that I was pleasantly surprised that both my wire antennas were still intact this morning. And I tested out the Hartley this morning with the same setup, and the frequency was stable again, so I'm pretty sure that was it.

I had copied all your info, but knew you couldn't get mine, so I will not be logging the contact for contest purposes.

One of mine, too. I also like heavy metal night (an AM event) and the AWA AM QSO party, but the operating style is always round-table and it makes it hard to tell who has contacted who. Fun nonetheless, though. Oh, the Linc Cundall is fun too; I always operate my 1929 station during that one.

>I also know
> you meant to type "1.5VAC" Your Arcturus '26 has the trippy blue glass,
> right?

Yes, an Arcturus 126 is a 1.5v fil BUT my tube is an AC 26 and yes, you read correctly 15vac. See the close up of the tube I put in the Arcturs photo album. I ran a variable DC supply at 15v to the filament. The tube has the cathode tied to one leg of the heater. Actually it's a carbon rod heater inside a tube which is the cathode, the carbon rod turns bright white when powered.

Arcturus made a series of 15vac tubes to directly replace battery tubes for electrifying battery sets. the AC tubes were their first line of tubes in 1927. The AC 26 is the rare-ist of the them all.

Today though, I received a pair of Arcturus 126 tubes in the mail. Might try one in the Hartely.

Yes, most of the early Arcturus tubes were blue but not all. I'd really love to get a blue #45 or pair of #30's!

Well I'll be dipped! That's a new one on me. Thanks for setting me
straight. Must've needed a lot of heater power to get enough emission
from the indirectly-heated cathode they were using, and this was
cutting-edge technology at the time. The "regular" '26 has a
directly-heated cathode, of course. Guess it's overdue that I invest in
a copy of Tube Lore.

OK. Again, I've learned something new, which is a Good Thing.

Why not? I remember there was an article in one of the Gernsback
monthlies I've got about experimental "UHF" oscillators, and one used a
type '26 operating in the vicinity of 1M wavelength!. The tank coil was
just a single loop, half in the plate circuit and half in the grid
circuit, with the only tank capacitance being the Cgp of the tube. The
loop was opened at the opposite end from the tube and shunted with a
large capacitor (for the frequency involved, somewhere in the vicinity
of a 0.002 mica) so that the grid and plate wouldn't be connected
together for DC. I've wanted to build one using a modified
back-of-the-set UHF TV loop antenna and see if I could get the thing to
work. But I digress...

This year's QSO Party was just as exciting as my first one, last year. Although conditions were generally good, I don't think they were quite as good as last year's superb propagation. Both weekends saw numerous short-lived enhancements, often just long enough to exchange the needed information before conditions fell off again. For the most part, signals were weak and fady but a few 80m signals (KB0ROB,VE3AWA and WA9WFA) all had my receiver's stingy s-meter past the s9 mark at times! As I mentioned last week, I am truly impressed at the skill of the QSO Party's participant's ability to copy such weak quirky signals and rarely ask for a repeat!

From the sounds of many signals, wind was an issue - not totally unexpected for our December time-slot. Even some of the usually rock-solid MOPAs were being pulled skyward. Unlike last year when I experienced winds up to 80 MPH and eventually had to shut down, this year the wind only reached 50 MPH tops. Just before the start, I added another tie-down to my wire vertical
40/80m system and the entire antenna (consisting of 5" ladderline elements suspended from the top of an 80' Balsam) was pulled as tight as a banjo wire. It seemed to do the trick and at the height of the winds on the second weekend, I was still able to work with only slight shifting of the note.

Once again this year, my vote for the best-sounding signal goes to Harold, KB0ROB, in Minnesota, for his xtal-like note and stalwart presence. The crowd from Minnesota is really amazing and without them, the QSO Party would be very much less than it is today. It is wonderful to see activity beginning to grow out west, with several new stations making their QSO Party debuts. Hopefully this trend will continue in the years to come!

Fully eight of my contacts were with stations running less than 5 watts. The fact that you can only squeeze a watt or two from your lashed-up TNT or Hartley
cannot be used as an excuse for not getting into the Party!! And speaking of TNTs and Hartleys...of my 41 '29 station QSO's, 20 were using Hartleys, 11 were using MOPAs while just 4 TNTs got into the log. It's interesting to note that the early Handbooks promote the TNT as the 'simple' beginners rig but in fact, I believe it is more difficult to properly optimize and tweek a TNT than it is a Hartley. Perhaps that is why the Hartleys really are more popular.

Although I managed to work more stations this year on 40m, I still think that this band could be better utilized during the early evening and post dawn hours. I listened to several east coasters calling CQ after CQ during the wonderful propagation offered on 40m during these times, but very few

other stations were active.

The second weekend suffers a terrible contesting
conflict with the SKCC's CW QSO Party as well and perhaps the dates for next year will need a re-look to avoid the mess. Many of my 40m contacts were on or around 7.110, away from the QRM down lower. Perhaps this should be our official QSO Party watering-hole for future 40m operations?

Thanks for one of the most enjoyable annual radio activities to be had. I'm already planning for next year's affair!

Just one data point, but my experience with each has been the TNT is a "sure fire" device, easy to get going and load, while my Hartley is very finicky and stops oscillating if loaded too heavily (even before the note stability suffers), and won't oscillate at all unless the '10 tube is a "strong" one. I have also been unable to get the Hartley to oscillate at all with a '45 or '71A (adjusting the grid leak value accordingly and playing with the tap on the tank coil that controls the feedback). The PP '45 TNT just works! Both are just as capable of frequency stability as long as they are loaded properly. There could be a subtle component issue with my Hartley, but I'll be darned if I can find it.

73, Steve, and fine showing from VE7SL!

FB Larry and admittedly my experience with both types of circuits is limited to just my own small sampling of one of each. The Hartley just works like a charm and is very stable...and, while the TNT also worked from the get-go, it's tendency towards frequency drifting and chirp was eventually solved by finding the sweet-spot for the grid coils. There must be other reasons why the Hartleys are so much more popular...maybe people just don't like winding grid coils!

Steve

What with everything else going on, mostly Christmas related, I managed to get on the air for only 50 minutes during both weekends. Fortunately there were several other guys on 40 meters and I made 7 contacts, six with guys running vintage equipment and one with a Mod 6AG7/1625 MOPA. The band was pretty good, because from out here in New Mexico I worked four stations in Minnesota, two in Colorado, and one in Montana. My rig is a pair of 10's in a Hartley Oscillator - Power Amplifier configuration.

Personally I would have been able to spend a lot more time on the air if the contest were not so close to Christmas.
Sometime in January or February would be a lot better. Does anyone else have similar problems?

As everyone in the group is probably aware by now, I'm kind of partial to the push-pull TNT circuit. Mine uses the classic pair of '45s, but a pair of '27s would do fine at QSO party power. Coupling links are unnecessary; I have a 50 ohm system and I tap slightly up one side of the plate tank coil from the center/B+ feed point through a mica condenser. The center of the coil/B+feed point also needs to be well bypassed to ground to complete the RF circuit to the antenna system. I use 0.02uF in both locations, which is enough to work well all the way down to 160M.

1317. 1929 QSO Party: WA9WFA EPILOGUE

Yahoo group: AWAGroup (2010 — 2011)
Date: 2010-12-15 15:44:11 UTC
From: whitebear1122@comcast.net
Topic: 1317 Message: 1317

I do enjoy reading the post contest reports from the 29'ers! The 2nd weekend was pretty much of a bust for me. We were in the middle of a major blizzard Friday and Saturday. Saturday night 9 PM the snow finally stopped and I had to go out and snowblow the 2'-3' of snow in the driveway so my wife could go to work the next morning. That took me nearly 2 hours of prime QSO Party time. Next morning I first had to go outside and clear the end of the driveway where the snowplows shove up a couple of feet of snow, again taking some prime 80m QSO Party time. Had family duties for 3 hours in the afternoon and missed the final 80m sprint up till 5 PM.

Propagation was rough in Minnesota for me. About an hour before the event, 80 and 40m suddenly was ripped up by some S9 roaring interference that lasted for several hours. I put the MFJ Noise Reducer and my 500 hz filter to work and was able to control the racket. Plus there was snow static from the 40 mph winds during the blizzard. I only picked up maybe 8 QSO's the whole weekend. I haven't double checked my notes yet but I was somewhere around 43 total contacts, with 2 of those being modern guys asking what was going on, so a total of around 41 1929 QSO's .

The East Coast was rough for me this year. I did manage to work several East coast guys but signals were just barely above the noise. I heard NE1S a couple of time over the weekend but wasn't able to work him. I also heard WU2D once and I think we worked. I don't have my log in front of me. It's still a treat to hear the 29'ers even if I can't work them. I was pleased to hear more West Coast stations to!!

My push-pull Colpitts "SkyMaster" was experiencing wind modulation as the antenna was whipping around in the winds. I heard alot of wind modulation on others as well, even some of the MOPA's were experiencing it. I didn't run into any other Colpitts configuration I don't think. I'm assuming Eddy VE3XY was running his Colpitts "Rocket" but I don't recall for sure. Was I the only Colpitts guy???

My Colpitts transmitter did fine, very minor chirp I believe, quite a bit of wind modulation on the 2nd weekend, and a propensity to suddenly shift 500 hz to a KHz. I know my connections were solid so I'm wondering if that jumpy behavior is coming from the pair of 400 pf fixed capacitors across each section of the split stator tuning cap. Those are the typical 70 year old transmitting caps so I imagine they have all sorts of odd things going on inside.

Next year I'm thinking of leaving the Colpitts on 40m and building a new transmitter for 80m. I have my eye on John Rollins TPTG transmitter design. As always, I seem to have bigger plans than available time, and then when the 29 QSO Party rolls around again, I'm simply dusting off last years transmitter . hi hi

The 40m comments are interesting. I agree that the 2nd weekend 40m was a real mess between the SSB stations, normal CW stations, the contesters calling CQ WES, the RTTY, the digital. Plus there was that wideband multiplex digital signal at 7050 for a long time. What was the deal with that I wonder. Wow. I did listen quite a bit up at 7110 area but didn't hear any 29'ers. I've read the comments here where several of the guys were making

in the clear QSO's up there. The CW WES guys were up there too. To Steve VE7SL's comment, yes we should plan on listing 7110 for next year as well as the 7040-7060. It would be great if we could get more 40m activity going.

That's about it for now. I can make more comments when I have the log and notes in front of me. It sure was a pleasure working you guys in the QSO Party!!

It is definitely an interesting configuration and is decribed in my 1933 Handbook as a 'Unity-coupled' circuit and a member of the Hartley family. I really don't see the resemblance at all.

(from W7OIL) If I were to use multiple #27's I will need to "grade" them for activity so as to get two with similar performance. Of my #27 stash, one was dead, several were so-so and one was "hot". The "hot" one is in the "Double-M". Also, If I make another "coil-within-a-coil" I'll go with 1/4"OD tubing and run RG-58 with the jacket and braid removed through it. The insulated #28 wire through the 1/8" OD tubing was like pushing a wet piece of spaghetti up a wildcat's .....nostril.

Advice request - what other tubes would be acceptable for a "1929" transmitter? I know #10's and #45's fit the bill but I don't want to take out a second mortgage to buy them.

BTW - I'll stick with calling the "Double-M" a unity-coupled oscillator. 8^)

27's. Maybe the tx tube bargain of the century :) . For several years I've used 27's in my 80 meter MOPA. It's a 27 Hartley oscillator driving a pair of 27's in parallel. I think I paid something like $3 or $4 each for the tubes, used on the internet, plus found a couple at the AWA convention for a few $. 73, Scott WA9WFA

2 cents again....

I wonder if a small resistor in the filament leads might be a way to balance the tubes if they are being used in PP? I seem to recall several rigs (Drake) that used something like that.

My apologies for suggesting a $90 pair of tubes. :-) I am use to the audio
side of tube hardware, and that price is considered reasonable, compared to
more esoteric brands.

I will have to scour ebay for some used 27s for my transmitter project.

Although I'm not sure of the exact year, I do know it was 1930 or later.
Therefore it doesn't quallify for the 1929 Bruce Kelley.

Well thanks again.

Ya know, that only works with meters that have long terminal studs.
The nuts and solder lugs just fit with nothing to spare.

BTW, I have some of Frank Jones 1935 handbook scans, maybe I should put them in the file section. Ken Gorden used to have them on his Glowbug site but they have disappeared of late.

While on the subject of push-pull xtal oscillators, don't forget the QRO member of the QSL series of transmitters. The QSL transmitters were designed by Fred Sutter around the 6L6 and published in QST starting in February 1938. Chassis size was about that of a standard QSL card. For the "QSL Push-Pull" Sutter used two 6L6s with a 600 VDC power supply to get 100 watts output.

My version shown at
http://w0vlz.blogspot.com/2009/01/awa-linc-cundall-ot-cw-contest.html
isn't real pretty but with only 300 VDC on the plates it's a little easier on 6L6s.

73,
Niel

How xtal-friendly are these Jones circuits...FT-243's OK?

Those Sutter rigs were scary!

Nice job on the scans Lou...should be very helpful...tnx to Roger as well.

From: john_kb7nrn
Topic: 1365 Message: 1365

Just added two folders to the files section.

Fist one contains transmitter projects from Frank Jones' 1935 Radio Handbook.

Second folder has files from Frank Jones' Amateur Radio Newcomer. A push pull 6L6 transmitter and power supply.

John

From: Louis Vermond VA3AWA
Topic: 1365 Message: 1366

THANK YOU, John!

Where to begin?

The white standoffs surprised me. Thought that the colour came out in the late '30s. Makes that procurement easier.

The 47/210 combination is interesting.

The Xtal P-P 6L6s beginner rig is a heart throb.

Like that narrow front jack etc. panel.

The top board L bracket mounted key connecter is unique.

It just goes on & on...

What say?, a 1930s oscillator rig Jones Party?

73, Lou VE3AWA

1367. Double-M photos

WAS on a PP 6A6 is pretty good there Tom!

I'll have to put together another PP Jones for 40 mtrs. The last one became a parts doner for the 1934 MOPA.

In the fall of 1965 when I started college at Indiana Institute of Technology in Fort Wayne, Chuck Bliley was my roommate for a while. He authored that pamphlet. Chuck is the son of the founders and that time his mother was running the company. Looking at the pamphlet again, of which I have a couple of originals, reminded me that I just received one of those oscillators from a Canadian ham in mint condition that is pictured in there a few times. Of course the main thing I got from him was a 1905 British Marconi Fleming Valve from 1905. Will have to post a picture of it. 73 - Mike

From: Don Buska - The Radio Lab Works
Topic: 1378 Message: 1381

FYI gang,

The latest issue of Radio World has thislinked article <http://www.rwonline.com/article/110138> on Clarence Kane. He has been repairing RCA ribbon microphones for more than 30 years and continues to do so using all the NOS parts left over from his RCA days. The article title (subject line of this email) is kind of misleading as Mr. Kane as always repaired these mics and has nothing to do with their development. Still for all of us restorers his work is something to be appreciated.

A fun read.

What a swell idea Lou!! I can see the annual "Jones QSO Party' being right up there with the B-K!

Let's get busy and pound out some ideas.

I really like your 'no power limit' but just how much power can a xtal stand ;-)

I can see everyone having to publish their xtal frequencies ahead of time perhaps, unless they are inside the window...and we all know how messy that can get. New upper QRG window...the old novice band on 40 perhaps?....and lots of tuning up and down the band after your CQ. Sounds like great fun.

I think this is cool.
Here are a few ideas:

1. TX, push pull xtal oscillator. Can be one or two tubes but no MOPA or such.
2. RX, 1940 or older homebrew or mfg'd. Regen, superhet, whatever.
3. Freq range in the old 40 mtr novice band.

How's that for a start?

From: Louis Vermond VA3AWA
Topic: 1389 Message: 1389

John and all.

1. TX, push pull xtal oscillator. Can be one or two tubes but no MOPA or such.

Great, but let's not limit it to P-P ckts.

2. RX, 1940 or older homebrew or mfg'd. Regen, superhet, whatever.

You're on a roll John, but using above not a requirement for participation, right?

3. Freq range in the old 40 mtr novice band.

Cleaver. Even I have Novice xtals, BUT PSE do not forget 80 mtrs!

Finally, let's pass a hat to keep Larry in xtals.

Lou

Just suggestions Lou.

The idea was to build a beginners station from the '30s, RX and TX for a real taste of vintage operations.

I don't expect everyone has a 1940 or older RX or can build one but if you can build a simple TX you should be able to build a simple RX. Right? I do think a contest where we build and operate a vintage station, preferabley homebrew TX & RX, should be considered some time.

Ok, back to your Frank Jones party... If not PP only rigs then what? Any FJ style TX?

80 mtrs, well ok. I'm just short on 80mtr xtals and my old novice xtals are in the phone band.

Well it's your party so I'll follow your lead.

John

Hi Group:

My dreams of QRO domination of the West Coast were dashed when I could not match two #27 tubes to run in parallel. So you folks like Steve McD can wear their cans all the way over their ears.

8^)

I *DO* have a globe style #47 in my antique tube drawers (and no ribald comments from you, Lou!), and I am thinking about running it in a Hartley circuit. I tested the filament tonight and got a nice glow.

Another idea for a QSO party: A 1x1 party. A one-tube transmitter and a one-tube receiver. To make things easier on the rx end one could allow a #19 tube (twin triode).

Wha's everyone planning to use in the Linc Cundall CW Contest in 3 weeks?

I could use my P-P 6L6 oscillator but I'll probably stick with my 1934
"46 job". See
http://w0vlz.blogspot.com/2009/09/more-1934-transmitter-it-works.html

I'll be on with my NTX-30 and with Command Sets BC-459 and CBY-52209 (Navy BC457), and possibly with my 1941 Meissner Signal Shifter. Receivers will probably be my HRO, NC-101X, NC-200, RME-69, FB-7, BC-454/BC453, and BC-455/BC453.

Now if the rules were like the Classic Exchange and I could make more than one QSO with the same station by shifting transmitter and receiver pairs, there would be a lot more activity on the contest.

My 2 cents,
I have had some success but not perfection, as follows:

The surface must be hospital clean to start. Buff with a very fine sandpaper, like auto motive "WetorDry" 300 grit or so. Wipe down with a non-petroleum based cleaner like MEK, Lacquer Tinner, Rubbing Alcohol. Be careful this stuff can be toxic, do outdoors. When spraying, put a light coat on first and let it get tacky, them a real heavy coat. Try and do just horizontal surfaces, one at a time. This will obviate running or "lace curtains."
If at all possible place the article in an oven at a low heat, about 150 degs. F, for 15 minutes or so. The crackle will begin to show very quickly. Don't remove the article until well cooled. I generally wait a day or two between coats. Keep the oven heat as low as possible or the paint will blister. I have found that the heat technique gives a finer
crackle than air-dryed.

Lou,

I like Roger have had some success but not perfection with wrinkle paint. I have found it difficult to achieve a consistent wrinkle at times. Instead of using an oven to accelerate the wrinkle I used a heat gun. And yes the surface must be very clean and free of paint or primer. The wrinkle paint gets applied to bare metal.

I prefer wrinkle finish powder coat to paint. I recently restored a NC-101X speaker cabinet and after a few failed attempts with the paint I threw in the towel and had it powder coated.
The wrinkle finish you get from powder coat is not quite as coarse and heavy as the original finish but its consistent and much more durable. On the downside a bit more expensive but worth it to me not having to deal with the paint mess.

73,

Joe

To the Groups

Journal production has been slowed down, as is inevitable, by the upcoming holidays . But more importantly we are switching our mailing mode from first class to non profit class. This mode is slower, but will result in a very significant savings in postage.

Because of the switch, it is unlikely that the January issue, with the Cundall rules and logsheet, will be in participants' hands in time for the event. However both are now available on our web site at antiquewireless.org

I will send out a "heads up" when the Journal is actually mailed.

Marc Ellis

My experience with wrinkle paint has been pretty much success everytime.
I've used two different brands of wrinkle paint that come in a rattle can from the auto parts store.

Like has been said, a clean dry surface is a good starting point.

A large cardboard box makes a great mini-paint booth.

Preheat item with small ceramic heater or heat lamp so it's warm to the touch but not too hot. It's also good to have the can of wrinkle paint at about 70*F before using.

Apply first coat like Roger said and let tack, then apply a heavy second coat. I've actually done three or four coats, always allowing the previous coat to tack before applying the second.

I must add that I have filled holes in steel cabinets and a few aluminum chassis with JB Weld epoxy, when sanded smooth, wrinkle applied, with no difference in the pattern from metal to epoxy.

From: Don Buska - The Radio Lab Works
Topic: 1421 Message: 1428

Another heat source is a standard hand hair dryer. It's easier than a heater and big box. I did my Bud open frame (3ft tall) rack that houses my Millen transmitter setup along with several rack panels (you can see it in my QRZ listing picture). I'd simply keep the dryer on hi-heat and at around 12" away from the metal and keep it moving so that I hit all areas. Without stopping the heating in about five minutes everything is all wrinkled up perfectly. Once the wrinkling starts everything happens very fast.

I've transported that Millen rack in my car out to the AWA conference and back home and the paint has held up great. The durability of my wrinkle paint jobs far exceeds anything I've achieved with my standard radio paint jobs.

The cleaning and two step paint application I use is the same as already presented here by others.

Hi Lou,

For whatever reson(s), wrinkle paint likes to do its thing---i.e. wrinkle---in humid environments...

Whenever we're south of the border, I like to stock-up on the rattle cans of wrinkle-finish paint at Pep Boys, etc. (I don't know why, but here in Southern Ontario you can only buy the stuff in motorcycle shops---and stay away from the name-brand H.D. variety, as one can alone will set you back some $25.00!).

Anyway, apply a nice heavy coat of the paint on a clean, pre-primed surface, then place your creation into the household oven (preferably when the XYL is out shopping!) at its lowest setting, AND remember to place an open bowl of water into the oven along with it (remember what I said earlier about humidity).

Check on the developing wrinkles every 5 minutes, or so. Once you have good even wrinkle consistency, remove the painted piece of art from the oven, & let it cool & air dry naturally for a day, or so...

Oh yeah, I almost forgot: open the kitchen window to air-out the place, before "The War Department" comes home...!

Thanks Eddy!

Dunno about the 845 performance yet. Still trying to dig up a fialment transformer.
Frank Jones rates it good for up to 10 mhz in his 1932 handbook.

Ah, gee Lou, you're making me blush! Live with it, OM.

Yes, I made the breadboard. I've admired the look breadboard projects in the '20s QST's so I had to make my own. Can you even buy an old style breadboard anymore? Funny, a moment ago I considered announcing here that "real" hard maple breadboards are still made in Quebec. See label below.

A size, 3/4" X 12" X 16" is available locally here. The manufacture probably has other sizes as well. As you'll see there is contact info for both Canada & the US. If anyone follows up, pse share the info.

1446. #47 tubes

Yahoo group: AWAGroup (2010 — 2011)
Date: 2010-12-24 05:00:17 UTC
From: dpetersen tds.net
Topic: 1446 Message: 1446

Yesterday I came across two good looking #47 tubes while spider hunting at the local surplus joint. Those and a 5-volt, 3-amp DC power supply (running filaments in series) set me back $8.00. Took 'em home and hooked 'em up. They both lit and draw 1.65 amps. Sounds about right. Now - what to do with them....

I have made a tuning and antenna coil for another 80-meter rig. Hartley with the two #47's in parallel? I don't know if I could handle the QRO. 8^)

Any ideas out there?

Just up loaded some photos of a couple space charge receivers built from Popular Mechanics article from 1936-'38.
http://groups.yahoo.com/group/AWAGroup/photos/album/1737802635/pic/list
http://groups.yahoo.com/group/AWAGroup/photos/album/119442677/pic/list

Also up loaded hi-res scans of the original articles.
In addition, I up loaded Roy Usher's, VE4EA, original 1935 QST space charge article. All the subsequent articles from Pop Mechanix and Lamp House Hiker's series of NZ are based on Roy's original article.
http://groups.yahoo.com/group/AWAGroup/files/Space%20Charge%20circuits/
http://groups.yahoo.com/group/AWAGroup/files/Space%20Charge%20circuit%20%231/

Since I've built the Pop Mechanix and Hiker's sets, I plan on building VE4EA's Space charge regen as a portable.

Enjoy,
John

Steve,
You're welcome.

The one tube AM BCB set had low audio but that's to be expected from even similar regens with higher plate voltage. The tuning cap is not a straight line cap so the stations bunch up at the top of the range. I just used what was on hand.

The shortwave set worked well. Wound coils for 160 & 80 mtrs. Used a 140pf straight line cap. CW and SSB came in no problem.

Going through parts to kit up my VE4EA version. Have a steel cabinet and most hardware. Plan to make it self contained with batteries in the bottom.

This is indeed a step in the right direction. I remember when I first participated in one, close to 30 years ago, it was pre 1940 gear. It stayed that way for a long time. Eventually WWII stuff was included, and now, 30 years later, they raised it to 1950. Makes good sense, and does allow more participants and multipliers. One of these years I'll have to participate again. HNY & 73 - Mike

1459. High SWR

Yahoo group: AWAGroup (2010 — 2011)
Date: 2010-12-28 13:25:45 UTC
From: Terry Hall
Topic: 1459 Message: 1459

Hello everyone,

I've been trying to get my 80 meter Hartley on the air, but I have not been able to get the SWR down to no less than 3 to 1 using an antenna tuner and a random wire antenna. The other night in an SKCC event the same antenna tuned flat with my TS-520 and 50 watts. Also, I get the same SWR with a G5RV Jr. that is supposed to tune for 80 meters.

The antenna coil is 3 turns of 1/4" copper tubing rigidly mounted next to the plate coil.

Is this characteristic of the older transmitters? I do have the room to put up an 80 meter dipole if I need a better antenna, but I am wondering if that is the problem.

Terry Hall

Hi, Happy New Year to all.
Regarding PVC tubing, while it is OK at lower RF freq's, you might experiment with other types. Fiberglass is better, but I have found plastic lemonade plast tubes (the kind that has little cups inside to make a liter of drink) as well as spice bottles - cheap ones found in Walmart for example , plus pill bottles all make nice forms. The first for lower AM and 160M bands, the smaller ones for higher bands. I test them in a microwave oven, starting with say 20 seconds then the best for maybe 1 minute. Those that stay cool are good for upper HF bands w/o problem as they are low loss. I have been looking for substitutes for an article I am writing to give alternatives for those who cant find or who don't want "official" plug in types (which I mostly use). 73 Karl Schulte <wa2kbz@...>

Hi Karl,

For years I've had good luck employing properly-sized polystyrene plastic pill bottles, nested into the bakelite bases of defunct tubes...

Specifically in this regard, I had a stash of burnt-out 811A tubes: I broke the glass envelopes off (safely, of course), cleaned-out the residual glue in the bases, heated the pins with a soldering iron, then blew-out (literally) the residual solder...

I'd next wind the coil on a pillbox---with pre-drilled holes at the base to match the pin locations!---then apply slow-cure epoxy at the bottom, & secure it to the inside of the old tube base (NOTE: you have to "fish" the pre-skinned wires through the appropriate pin, first!). Once cured, I'd solder the pre-skinned wires to the inside of socket pins...

VOILA!

A cheap, easily-made coil form & base, which will withstand umpteen amounts of "pulls" & "re-plugs", by virtue of the fact that all of the stresses of same are exerted on the rugged tube base, as opposed to the dmore delicate coil form itself...

Oh yes, one final point: use ordinary, "dollar store brand" (i.e. "the cheaper, the better!) clear nail polish atop the coil turns, to secure the windings. Two coats are probably best, & this should be done BEFORE any "man-handling" of the coil/coil form into the tube base...

Works for me!

Terry,

It sounds like you are having the SWR problem with your Hartley and two different antennas while these same two antennas show a 1:1 SWR with your TS-520.

My Hartley/SWR looks fine with an antenna tuner and end fed wire antenna.

I had your sort of SWR problem when I had a bad parasitic (or maybe it was a harmonic) problem. The antenna tuner and/or single band antenna is only 1:1 at one frequency. Any stuff on other frequencies gets reflected back and drives up the SWR.

You might try checking the SWR into a dummy load. If your SWR is low on the broad band dummy load then focus on what might be trashing your signal.

73,
Niel

Hi Guys,
I recently bought a dozen 6 pin coil forms from Play Things of Past. The price was reasonable and he even threw in one extra form. I also bought some variocouplers and tube sockets. He has a treasure chest of old radio parts. For Q dope I dissolve styrofoam shipping pellets in Toluene. A whole gallon bucket of them will dissolve into a small medicine bottle. If you can't get Toluene (they stopped selling it here) you can use MEK with a little Xylol mixed in. Works good for me.

Leonard

Hi Terry,

The problem is probably that the output from your Hartley has some harmonic content, which is being reflected by your antenna system. Which is what you want, since you don't want to be radiating the harmonics. You can try to reduce the harmonic output of the Hartley, but it may not be necessary.

My 2 cents,
Remember, most of these rigs used voltage feed and are looking for Hi-Z. What configuration is your tuner? Pi, T, Z, etc.

Hello everyone,

I've been trying to get my 80 meter Hartley on the air, but I have not been able to get the SWR down to no less than 3 to 1 using an antenna tuner and a random wire antenna. The other night in an SKCC event the same antenna tuned flat with my TS-520 and 50 watts. Also, I get the same SWR with a G5RV Jr. that is supposed to tune for 80 meters.

The antenna coil is 3 turns of 1/4" copper tubing rigidly mounted next to the plate coil.

Is this characteristic of the older transmitters? I do have the room to put up an 80 meter dipole if I need a better antenna, but I am wondering if that is the problem.

Hi Terry,

This suggestion would require a new antenna, but I have been using the Windom for my '29 oscs. (and other HB one tubers) for a number of years. It is high imped. and for the '29 TNT I just tap the feed line to the tank coil...through a Sangamo. Some would not like that way of doing things, but have never had any reports of harmonics. On the '29 Hartley, I loose couple with about 6-8 turns of 1/4" copper tubing, and tap the Windom feed line directly to that coil. My Windom is from the orig. TNT article...was called a off center fed Hertz back then... in the Dec 1929 QST. You could also make one for 40, which of course, would be shorter. One year in the ' 29 QSO party, I worked K6TQ , on 80m, with the TNT running 4 watts input...so the Windom works pretty good for me.

I do the same thing on my TNT, but closer to the "cold" end of the tank
coil to feed a 50 ohm system. On 80M on my rig this works out to be
about half a turn from the B+ feed point.

Hello,

Today while looking thru a bound year of the RSGBs, Wireless World & Radio Review, 1924 I saw the photo / caption now uploaded in my Photo Album, VE3AWA. Click, "View: Original" and you will be able to study the rig and read the caption quite well. Note the jar in the centre of the 'instruments' on the table.

In the text the jar is identified as a, '...variable grid leak, consisting of wires immersed in water.' This is new to me. Does anyone have the dope on this type of leak? Appears to have something more than just water.

It depends on the water. The resistivity of pure (de-ionized) water is quite high, but not being able to quantify that presently, it *may* still be possible to build a grid-leak in the tens of megohm range, which would still work (depending on the circuit and the associated grid capacitor value).

Tap water will have varying amounts of dissolved ions, which will lower the resistivity and probably be fine for the ones to tens of megohm range.

You can make a fairly low value variable resistor this way by dissolving table salt in the water.

From: Louis Vermond VA3AWA
Topic: 1475 Message: 1484

Thank you, Bill.

I use a #47 or #49... Perfectly in keeping, great. Not only do lamps introduce signal distortion, but use up precious mili-watts as well.

Often when discussing OT rigs with others I mention the guy who uses the capacitive coupling method. The reaction is first trepidation, then awe, and finally, envy. Vry FB, OM.

73 & CU Cundell, Lou VE3AWA

Hi Lou,

I use a #47 or #49 (depending on power) pilot lamp in series with the feed line, with a knife switch to short across it after tune up. Leaving it in line causes some chirp...and I don't need any more of that...hi.

My 2 cents,
Everyone seems to be trotting out ideas for the upcoming LC test, so here goes:

I try to use the older style signal reports with PDC, X, K, or C as appropriate. It adds a certain character to our test QSOs. It may confuse the unwashed masses though. Just in case, they translate to:

PDC - pure DC note
X - Crystal note
K - Clicks
C - Chirp

For instance - 579 X. Don't use it unless the signal does not merit the accolade. It is meaningful if used correctly.

I've been telling all my non-AWA friends to jump "in the waters fine."

Nice job Dan. My only comment would be, that since the output is not 50 ohms anyway, and it does not appear a ground connection is going to it, why not use a ceramic post or other type of connector for the RF out. Hope there is no smoke, HI. 73 & HNY - Mike

...what is the front panel material?

Why Steve, I am surprised you'd ask! 8^) Would you believe it if I told you it was real bakelite? No...I didn't think so. It's actually plexiglas (aka * "Fake*lite") that has been sanded and painted with semi-gloss black paint. Plexiglas IS a vintage material you know! ;^)

It has a link output coil for a low-impedance antenna connection. Ladder-line would be nice but my shack location precludes its use. So coax it is out to the antenna about 200 feet out in the east field.

First smoke test showed something was mis-wired and I am in the process of fixing it. Nothing fatal happened - both the transmitter parts and I are still alive. Building and troubleshooting, that's the fun part. I was pleased to find three 6L6G's at the surplus store. I purchased two and Bob Lee tossed in the third one that has the center alignment pin missing. It works FB - I just have to be a wee bit careful plugging it in...

16:00 Sunday: KB7NRN and I finally had our QSO. We are 73 miles apart. That makes a whopping four states and one province for me. His Hartley and my Double-M chirped away for about 1/2 hour. Thanx, John - a card will be in the mail.

Funny you would be looking for one of these, Lou, as I'm preparing to replace the ugly modern square resistors in my Harley with one of these. I could spare one, however the ones I have are only 20 ohm CT (10 ohms each side of the center tap). If you can use one, it's yours.

Also finally had success replacing the '10 in my Harley with first a '45, then a '71A, making 7 MHz RF. Earlier attempts had failed, with a strong '10 being the only tube that worked. I changed the grid leak resistor from 10Kohm for the '10 to ~50Kohm for the other tubes, but had done that on previous attempts too, as well as adjusting the feedback tap for more feedback. Think I'll operate it with the globe '71A for a while. Just as much output as the '10 with 9W DC input to the plate in both cases.

And finally I plan to be on the 160M AWA net tonite. How about you?

1508. variable grid leak? Ask Larry

Yahoo group: AWAGroup (2010 — 2011)
Date: 2011-01-03 20:03:46 UTC
From: Louis Vermond VA3AWA
Topic: 1508 Message: 1508

Many thanks, Larry. The salt would account for the cloudy appearance. I'll try this out and report, but keep it close cuz we don't want the grid leak market to collapse. Lou

It depends on the water. The resistivity of pure (de-ionized) water is quite high, but not being able to quantify that presently, it may still be possible to build a grid-leak in the tens of megohm range, which would still work (depending on the circuit and the associated grid capacitor value).

Tap water will have varying amounts of dissolved ions, which will lower the resistivity and probably be fine for the ones to tens of megohm range.

You can make a fairly low value variable resistor this way by dissolving table salt in the water. 73, Larry/NE1S

Hi Doug and the Group:

The program is called "Spectrum Lab" and you can find it at
http://www.qsl.net/dl4yhf/spectra1.html
It's a bit tricky to use until you get used to it.

There are two other packages that are much simpler to use, "ARGO" and
"SPECTRAN" found at http://www.weaksignals.com/ . All work with computer
sound card input.

According to the help files, you should be able to add the image providing you send it to the group via your normal e-mail software and not from the group's page. I tried this. The message I received from the group indeed had my image but the message on the group's page did not. I do see some Yahoo groups with an 'attachment' option in the menu items listed to the left but our site does not have it for some reason....hhhmm.

>so it appears with the text.

It appears the way it is presently configured is that you can add a photo to your posting but it will not be stored on the group page. You have to use your normal e-mail program and add an attachement as usual. Those receiving their group postings via e-mail will see the photo. The other option, that allows the image to be seen with the mail on the site, will not send the image to those receiving their postings via e-mail...basically the opposite of what is now happening. The third option allows for no images, either way. I'm not sure how many receive the posting via mail compared with how many choose to go to the group page to view postings...likely more use the former method...so they will see the images in their mail.

Thanks Dan, I appreciate the info.

Doug

John, do you know what software Dan was running in that screenshot ?
Thanks
Doug WA6VYN

Hi Doug and the Group:

The program is called "Spectrum Lab" and you can find it at
http://www.qsl.net/dl4yhf/spectra1.html
It's a bit tricky to use until you get used to it.

There are two other packages that are much simpler to use, "ARGO" and
"SPECTRAN" found at http://www.weaksignals.com/ . All work with computer
sound card input.

From: Joseph
Topic: 1524 Message: 1524

Hello All,
I realize this may be slightly offtopic, so please excuse me if you feel it is. it is a WTB for vintage power and driver transistors:

Would anyone have two new MRF458 final transistors, two new MRF433 driver transistors and finally, a MRF 2N3866 transistor, all for the PA of a Swan Astro 102BX?

Any help with locating these (preferably) new would be greatly appreciated.

Please send any replies directly to my email address at: n3ibx@...

Mod-U-later,
Joe Cro N3IBX

Perhaps "resistor in "C-eh?-N-eh?-D-eh? should be spelled "resistour"? Like harbour, labour, etc... 8^)

1528. 6L6 transmitter

Yahoo group: AWAGroup (2010 — 2011)
Date: 2011-01-04 16:52:11 UTC
From: dpetersen tds.net
Topic: 1528 Message: 1528

Hi group:
I finally had some time to re-do parts of the 6L6 transmitter. It now has a 200mA meter rather than the 100mA unit and I fixed the miswires and put in a couple of neglected ones. This is what happens when I clean the bench - things get all screwed up!

Smoke Test:
No smoke...amazing! I keyed down and still no smoke. The plate dips sorta OK and the old Heathkit field strength meter said something was coming out. The tuning was too near minimum capacity for my taste so I shorted a turn on the plug-in coil. Now it dips higher on the cap. The two 100-ohm, 2-watt load resistors in parallel got bloody hot pretty quick. So tonight I hook it up to the outside world on forty meters. I'll test it on 7050 first in case it decides to crack a crystal - I have spares. If all goes well I'll go to 7032 or 7037 and CQ. Probably 19:00-ish Pacific Time. I have an 80-meter coil but I need to find my 80-meter crystals!

Note to Lou - The meter in the Handbook schematic is shown backwards. the (+) should go to the key... 8^*P

John,

Dan's transmitter is a fairly popular 6L6 design from the mid/late 30s.
My example (with schematic) can be found at
http://www.prismnet.com/~nielw/6l6/6L6.htm

73,
Niel

No problem, we've scared him out of the woodwork now!

I do agree that a call sign, if one is licensed, should be in place at the profile.
If someone does not yet have their ticket, but still enjoys this old gear, they will be quickly converted when
they see how much fun it is!

Did you ever buy that old schoolhouse in MI?

Bruce -

No, the school house is history a long time ago. I came to my senses, HI (only cost me $3K for that piece of education).

Regarding GPT-750, I have not seen his email that you mentioned. Of course a call is not necessary, as some do not have one, but, I assume GPT-750 would be a ham. However, I would think a name would be mandatory in the profile.

I was going to do that myself officially on Yahoo, but, figured this would get him active. Well, the school house story is too long, maybe one day on the phone. Suffice it to say that it is further north than Montreal, and, the monthly heating bill in the winter used to be around $20K when it was still open about 6 years ago. It would really have been ideal located in a warm climate. Whenever it is about 30 degrees here, it is usually about -10 there (F). 73 - Mike

1547. Re: [AWA Group] Confession

Yahoo group: AWAGroup (2010 — 2011)
Date: 2011-01-05 16:19:11 UTC
From: Bruce W1UJR
Topic: 1541 Message: 1547

Yes, you're sadly correct, the K3 is not a true kit like the K1, KX1, K2 - which I've also built.
The K3 is no solder - yikes!
Still, supposed to be a very nice rig, was curious if others have used it.

Since confession is good for the soul, and the best way to honor
resolutions to share those with others, here is the plans for 2011,
to be done concurrent with the K3 build.

W1UJR Primary Goals in 2011:
Get healthy again so I last a few more years on this earth
and lug these old boat anchors around.

Get my CW proficiency and speed up to a point when I am
not embarrassed to operate on the air or AWA Contests.

Some where along the line, get married to the ever patient
and long suffering Nancy, between radio meets and project of course. :-)

Cull the ever-growing radio herd, get rid of the various
unused, unloved or unneeded sets and rigs which
have been in storage for the last 9 years.

Build an old time RX and TX from scratch,
I have the parts, just need to pick a design
and actually do it. Wooden base of course.

Actually write something again for Electric
Radio, and get my Transmitter columns
in BEFORE the deadline.

Visit the new AWA Museum.

Don't buy an old schoolhouse in the upper
peninsula of Michigan.

Line up for Bruce's Bench First Quarter of 2011:
Doerle set - get working properly

National SW-3 - check out and test

National Doghouse supply - get at least two recapped and working again

Lafayette RB-46 - finish restoration

Regen kit from last Christmas - build!

Wooden orange crate TX - build PS

Gross CB-46 TX - incorporate into 1930 station

T/R switching unit - design and build for old rigs with balanced RF

Collins 30K-4 - sell rig to good home

Cordially,
Bruce J. Howes

Hi Bruce,

I've had a K3 for about a year-and-a-half now. Excellent rig, top-notch receiver and filtering, great weak-signal ability, compact, excellent customer support, active user community, very easy to put together. Dislikes: SSB and AM audio is just OK (not up to the Kenwood audio I was used to), needs higher quality knobs.

Good luck on your projects.

Steve, KK7UV

Bring 'em on. MI-6 or any other "intelligence" organization. The only one that would scare me would be the Mussad (Israeli).

The way I look at it is if hadn't been for the USA, Europe would be speaking German.

Lou has a good sense of humor.

Roger.

If you guys have not visited this museum, it is worth the drive to Nevada just to see the things he has...all set up like a museum in the massive bottom floor of an extremely large heritage home sitting on the edge of a steep hillside, overlooking an expansive valley in the beautiful Sierra Nevada mountain range. Almost all of his collection comes from the Reno area and because of their very dry climate, none of the equipment has suffered the damaging effects of humidity...most of the none-restored gear is shiny-new and looks as though it has just come from the factory.

Hi Eddy,

Hope we get to meet some day...back from the days of W2UJR right.

I don't want to turn this into a K3 reflector, but thought someone else
might have one of these.

You're quit right, I heard the "stereo" reception at N2BC's home over the holiday, it
was nothing short of amazing, like I was hearing, if you can imagine,
the signals right in the center of my head. Some sort of audio delay
scheme but it works.

Don't worry fellows, still love boat anchors, this is just a momentary
sidetrack. :-)

Cordially,
Bruce J. Howes

Thanks Joe, the K1 is a very neat little rig, especially with the internal battery.
I'd love to modify it for general receiver and wider audio, would make a great bedside SWL set.

I can't recall if the K1 or the KX1 was my first Elecraft kit, but man did I love the process....except for
winding those toroids!

Enjoy!

1556. 6L6 TX

Yahoo group: AWAGroup (2010 — 2011)
Date: 2011-01-05 20:37:19 UTC
From: dpetersen tds.net
Topic: 1556 Message: 1556

First results from the 6L6 transmitter:

40-meters tunes up fine, nice plate dip at resonance and about 12 watts out with 400 volts @ 75mA . 80 meters dips nicely however has only about 5 watts outwith 400 volts @ 50mA. This with the proper "National" tuning coil with link output. I thought the reactance on the 80 meter inverted vee may be the culprit but the results are the same on the dummy load. I suspect either the link needs adjusting or weak crystal activity. Any other ideas from the "Peanut Gallery"?

My 2 cents,
I remember fixing just such a rig for a friend in VT. My recall is that is seemed sensitive to screen voltage. He had wired a bypass cap from the hot side of the tank to ground! The screen resistor was an old carbon that was way out of tolerance. I stuffed a 10 watt wirewound in its place. My recall was that was good for about 7 watts on both bands.

Hi Dan.

I agree, probably the link needs work. I'd add turns and put a variable capacitor in series with the ground side of the link (between link and ground), if you don't already have one there. A three-section broadcast variable with all three stators in parallel should do the trick - rotor to ground, stators to "bottom" of link.

Crystal activity differences could also be responsible for the lower output on 80M; easily checked if you have an assortment of 80M and 40M XTALS.

73/GL,
-Larry/NE1S

Yes, right, wondered Lou.
I know that most of the Q signals can be used as a question or response, was just trying to understand what he was getting at.

Neat card, noted the "192" in the date field, that sure nails down the vintage.

Topic: 1574 Message: 1574

Howdy All,

Yesterday, I got the HQ-129X working agn and looks like I will be able to use it and a 6A6 Jones P/P rig in the Linc Condall Contest. Not sure the actual production date of my HQ129x, whether pre of post 1950. Production began in 1946 (??) and contenued through the early 50's. My question is, does it comply with pre 1950 requirments for the contest or should I consider it a modern receiver. I have not tried to date it from the serial number, but it does not have any red lettering on the front so I know it is not the oldest version. TX36/RX46 or MOD??

Either way, looking forward to the contest, it will be my first contest as an AWA member.

73, Tom

Good question!

The little TX built using the wooden slats from an orange crate, uses a 6V6 tube.
Some folks know it as the "sucker stick" TX as it uses 3 lollipop sticks to hold the coil form.

Was in the "How To Become A Radio Amateur" book, and I believe possibly QST.

See http://www.eht.com/oldradio/arrl/2008-01/classic-xmtr-kit.htm.

Tom - my take on this and similar situations is to look when the model first appears and the HQ-129X would certainly qualify in all respects!

Good question!

The little TX built using the wooden slats from an orange crate, uses a 6V6 tube.
Some folks know it as the "sucker stick" TX as it uses 3 lollipop sticks to hold the coil form.

Was in the "How To Become A Radio Amateur" book, and I believe possibly QST.

See http://www.eht.com/oldradio/arrl/2008-01/classic-xmtr-kit.htm.

Hello Bill: The Cardwell 54 was never produced. Putting ads like that out there, especially after WW2, was a good way of testing the waters and see what kind of reaction came from potential buyers. RME was good at that with their futuristic console mounted radio and never produced transmitters. Fun reading tho. The Moore Book mentions this as an advertised only radio. 73,

I was thumbing thru the July 1946 QST and ran across a page and a half ad (pg.98/99) from the Allen D. Cardwell Corp. announcing their 'Cardwell 54' receiver. It is dipicted as being a very modern looking rcvr with a lot of features for the time. Advertised freq. coverage was up to 54 mc. Anyone know if any were really produced. Just curious...tnx, 73 de Bill K4JYS

1594. Neutralizing

Yahoo group: AWAGroup (2010 — 2011)

From: Roger Kuchera
Topic: 1594 Message: 1594

Hello Gang,
One of my least favorite things to do is neutralize the 830B in my vintage TX. I've tried several methods:

1. Disconnect B+ on PA stage, Tune plate tank through resonance while watching the grid current meter.
2. Use of milliammeter and diode to detect RF in the plate.

And so on. I don't like any of the classic methods as they are not precise enough.

An idea that has come to mind is to use a separate RX, hopefully with an S meter. Short the antenna terminals. Turn the RF/AF controls WAY down. Tune in the TX and adjust the neutralizing cap for the least S meter reading. One has to remember to disconnect the B+ from the PA and to keep the grid circuit peaked.

I guess I am asking this League of Extraordinary Gentlemen if they they can find any problems with this idea? Better yet is there anyone with a better idea?

BTW: I find slight differences in the neutralizing cap from band to band.

As always any help is appreciated. Thanks.

CUL, Roger/K1TG

I've used both the above methods, and they are both satisfactory when the PA stage can indeed be neutralized. And when they can't that's the fault of poor PA design/layout*, not the neutralization method.

* I speak from experience with one of my homebrew contraptions from long ago - never could get it to behave on 10M!

> with a better idea?

The RX will still pick up a strong signal from the driver stage. This could only work of the TX stages before the PA are well-sheilded and isolated from the receiver, and the PA plate circuit is somehow loosely coupled to the RX. The direct signal from the driver stage (not leaking through the PA) may still be too strong for this method to work.

I usually just remove plate power from the PA stage, connect the PA output to the proper load (usually 50 ohms), and hook a scope across the load. You can estimate the frequency on the scop to make sure you're not trying to null a harmonic, etc.

>
> BTW: I find slight differences in the neutralizing cap from band

Hard to eliminate that kind of effect in the real world, but hopefully it's minimal.

1603. Linc Condall Contest Question

Yahoo group: AWAGroup (2010 — 2011)
Date: 2011-01-07 00:23:21 UTC
From: Joe Cro
Topic: 1574 Message: 1603

Hello Tom,
I may not be able to answer your question exactly, but perhaps I can shed some light on your question about Hammarlund HQ-129X production dates.

To my knowledge, the original HQ-129X variant was made available sometime during very late 1945 or very early 1946 at the latest. Hammarlund started to advertise in "Radio News" and other publications approx October or November of 1945 whilst the receiver was still in pre-production.

There were variants with red lettering, (possibly the earliest) white lettering and black lettering. All variants had smallish main and bandspread tuning knobs that were usually replaced with something larger and more robust. The Hams at the time didn't quite like the feel of the small knobs!

IMHO, I would think that all variants would qualify as being a pre-1950 receiver since the basic design of it came out in 1945. The models in the series that preceeded the HQ-129 were the "RBG", kind of a modified WW-II Military version of a HQ-120, and the venerable HQ-120 that was made available in December of 1938.

The "RBG" is particularly a hot receiver fir it's type and can even receive up into the 10M region quite respectably. It resembles a HQ-120 in some ways with the S/Meter of a Super Pro 200/210 series.

I hope this helps.

GL in the contest and 73, es Joe Cro N3IBX

Howdy All,
Yesterday, I got the HQ-129X working agn and looks like I will be able to use it and a 6A6 Jones P/P rig in the Linc Condall Contest. Not sure the actual production date of my HQ129x, whether pre of post 1950. Production began in 1946 (??) and contenued through the early 50's. My question is, does it comply with pre 1950 requirments for the contest or should I consider it a modern receiver. I have not tried to date it from the serial number, but it does not have any red lettering on the front so I know it is not the oldest version. TX36/RX46 or MOD??

Either way, looking forward to the contest, it will be my first contest as an AWA member.

□
Hello Bill: The Cardwell 54 was never produced. Putting ads like that out there, especially after WW2, was a good way of testing the waters and see what kind of reaction came from potential buyers. RME was good at that with their futuristic console mounted radio and never produced transmitters. Fun reading tho. The Moore Book mentions this as an advertised only radio. 73,

I was thumbing thru the July 1946 QST and ran across a page and a half ad (pg.98/99) from the Allen D. Cardwell Corp. announcing their 'Cardwell 54' receiver. It is dipicted as being a very modern looking rcvr with a lot of features for the time. Advertised freq. coverage was up to 54 mc. Anyone know if any were really produced. Just curious...tnx, 73 de Bill K4JYS

I was pleased to receive a QSL fron Bert, KB0MM in yesterday's post. I was especially pleased as I had worked him with my "Double-M" transmitter. Interesting coincidence.... His TX was a 1929 MOPA at about ten watts. Thanks, Bert!

Hi Larry,
Thanks for the input. I am extremely anal when it comes to neutralizing a PA stage, so I tend to pick be picky. I'm going to try the RX method and see how it flies. I'll send along suitable comments when I am done playing with it. The differences from band to band are small but noticeable.

Roger -

The 'classic' method of neutralization is to apply a signal to the OUTPUT of the (non-powered) amplifier, connect a sensitive detector (receiver) to the INPUT, peak any tune and load controls, and then adjust the neutralization cap for minimum indication in the receiver.

Lou,
Exactly. Andy UU1CC was looking for a detaild photo of the REL Globe Girdler. The REL ads seem to be in
the 1933-34 QST's and this Pop Sci article is 1932. Makes you wonder if REL just "borrowed" the design.

Did they have push pull transmitter before 1930? Would this qualify for the 1929 QSO party if the right

tubes were used? Inquiring minds want to know.

1621. VFO to Transmitter Interface Problem

Yahoo group: AWAGroup (2010 — 2011)
Date: 2011-01-09 01:35:16 UTC
From: whitebear1122@comcast.net
Topic: 1121 Message: 1621

I'm trying to get my 1934 Gross CP-100 up and running with a VFO for the upcoming Linc Cundall OT.

It works fabulously... with crystals. I have been unable to get a VFO to work with it so I''m wondering if someone here has some insight. The oscillator looks like a Pierce with the crystal and a 10K resistor in parallel from grid to ground. The tube is a type 47.

The 47 drives a 210 buffer which drives an 838.

It runs FB with a standard FT-243 crystal. I have been trying to interface a Millen Vari-Arm vfo with no luck. In desperation I tried an Eico 755 as well. In each case the oscillator runs at a different frequency, nothing close to where the vfo is running, crappy signal besides. I can't figure out what the problem is.

The Vari-Arm has inductive coupling to the oscillator while the 755 has capacitive coupling.

Is there some simple solution that is obvious to all except me?>

Thanks, 73, Scott WA9WFA

How are you connecting the VFO to the 47? I do not know your exact circuit, but, it seems you cannot connect the VFO to simply the crystal socket. The crystal socket is not connected to ground. Try connecting the low (ground) side of your VFO to the ground of the 47 circuit and then try to connect the hot side (RF) to one of the two crystal pins. One should work. 73 - Mike

I generally use my oscilloscope attached to the output link as an RF indicator, then adjust the neut cap or link for zero feedthrough with the B+ romoved from the amplifier stage. Any scope with sufficient bandpass and sensitivity will work just fine.

Hi Jim,
    Thanks for the tip. The pick up coil seems generic the measuring device varies; micro/milliammeter, recevier, scope. You are absolutely correct on the minimum feed through. Take care and stay warm.

The Gross oscillator appears to be a Pierce circuit with the crystal and a 10K resistor in parallel from the grid to ground. The one side of the crystal socket is grounded, other side goes to the grid. I've played with switching the Eico output and Vari-Arm output around to account the hot side and ground side.

I'm thinking it's simply a case of inadequate drive, so I may simply have to build up a buffer. I was hoping there would be an "Easy Button" to press, or something obvious that I was overlooking, but I don't think that's the case.

I'm going to look at breadboarding a buffer this week and try it out. I'd really like to use that Gross in the Linc Cundall this year. Thanks, 73, Scott WA9WFA

How are you connecting the VFO to the 47? I do not know your exact circuit, but, it seems you cannot connect the VFO to simply the crystal socket. The crystal socket is not connected to ground. Try connecting the low (ground) side of your VFO to the ground of the 47 circuit and then try to connect the hot side (RF) to one of the two crystal pins. One should work. 73 - Mike

Scott –

Are you sure the crystal is also grounded? In a typical Pierce it is part of the feedback circuit. The 10K to ground sounds right. I do not he the schematic, but I guess you have convinced yourself that one side of the crystal is ground. The only other thing is just make sure in that case you have tried to connect the VFO to the xtal socket both ways, just to make sure you are not grounding the grid, and connecting the RF input from the VFO to ground. Sounds strange. I think it should work right off. A buffer or additional drive should not be needed. 73 - Mike

Good advice, Mike. And you're right on - in a Pierce the XTAL is in the feedback loop, connected between the grid and plate (usually with a DC blocking cap). In the "modified Pierce", the screen grid actually is being used as a plate so the XTAL is connected between control and screen grids.

An example of the Pierce can be seen in the schematic for the Elmac A-54; the modified Pierce is used in the DX-100.

I too don't have the schematic for the Gross rig; if I did I may be able to offer additional suggestions.

I'll have to double check this. The Millen Vari-Arm has a capacitor in series with the link coupled output. I may need to pull that assy apart and make sure it's really there and not leaking like a sieve. I assume the Eico does as well but I haven't checked. 73, Scott WA9WFA

Scott - have you insured that your VFO is capacitively coupled to the grid to avoid upsetting the tubes bias and added a bypass cap for rf to the cathode of the original oscillator circuit?

Scott –

Seems like one of us does not know oscillators. You called yours a Pierce, however the schematic depicts a typical Colpitts (Hartley). No wonder you never had the courtesy to acknowledge my replies, we were talking cross purposes, which may be your VFO connection problem as I tried to tell you. Maybe you should pull one of the ARRL handbooks of the shelf, HI. 73 - Mike

Hi Bruce, Scott. Mike, and list....

This isn't Scott's radio, as his tube line-up is 47 -> 210 -> 838 (IIRC).

But the XTAL osc. may be the same, in which case it just appears to be a
tuned-plate-tuned-grid XTAL osc. circuit (not a Pierce osc.).

I see no reason why just poking the VFO into the 47 grid , with a series
DC blocking condenser, wouldn't work, but apparently it doesn't for Scott!

Larry –

Exactly – that is why I mentioned to make sure he does not ground the grid with the link coupling, or, have the input connected in reverse when using the cap coupled VFO, as he said he tried both. As I said, with a Pierce, his attempts would not work, unless he went directly into the grid with cap coupling. It does not matter what style xtal oscillator one uses, when using a VFO, the feedback is no longer required. However, watching the input is important. – 73 - Mike

My thanks to the guys here for the ongoing assistance with this VFO interface problem and my apologies for not acknowleging the comments and help in a timely manner. Due to constraints I post very little and don't respond quickly . True I'm not a oscillator expert so that's why I'm pinging the group for help with this interface problem. I was hoping there would be an "Easy Button" to push but apparently not.

I figured it would be an easy interface. The Gross oscillator simply has a 10K or 15K resistor in parallel with the crystal, connected between grid and ground. There are no other connections to the grid pin. The Millen Vari-Arm has a inductive coupling with a capacitor in series. I made sure I was applying the capacitively coupled signal to the type 47 tube grid. Nothings going to happen if I apply it to ground. I did have the transmitter out of the cabinet over the weekend to draw out the schematic so I am very sure one side of the crystal is grounded. One of the crystal sockets is literally bolted to chassis ground and paint scratched away.

Now to Mike's point, I can put a meter across the Vari-Arm link coupling output and see if there's a cap in line. If not then I'm grounding the grid. The Millen schematic says there is a series cap so I was assuming. I'll check it.

I have a frequency counter nearby and the tx frequency isn't anywhere close to 3.5 MHz, and the oscillator changes frequency on key down. The Vari-Arm does not control the frequency or have much affect on it. I was wondering if that circuit needs alot more drive than the Vari-Arm or Eico 755 provides. Or there is some isolation or lack of isolation problem between the two.

So I'll keep plugging away. Thanks for the help.

73, Scott WA9WFA

Good luck Scott, and let us know what you find out, I might run into the same thing with the CB-25.
I picked up a Millen unit earlier this winter, have not yet tried it with my Gross rig, thought it would be handy to have around.
You'd think the Millen VFO should more than enough drive for the Gross, especially if you're going into the 47 and following stages to goose the signal up.

Since you're an old pal, tell you what, I'll help you out and take take old rig off your hands.
I've got a nice reliable and safe Elecraft K1 to swap for the big Gross, you know how dangerous those tube rigs can be.
You know, something dependable, you don't have to diddle with, just plug and play, after all, no one uses that old tube stuff any more, right? :-)

Cordially,
Bruce J. Howes

Hi Scott,

One possibility is the type 47 is taking off as a TPTG oscillator, with the output tank circuit of the VFO acting as the grid tank circuit. The link coupling would reduce, but not eliminate, this possibility. While the Cgp of the type 47 is less than that of a triode it is still appreciable at 1.2 pF.

You might try running the 47 stage as a frequency doubler rather than straight through, i.e. VFO output on 160M for 80M operation. I don't know if the Millen VFO has output on 160M?

1644. VFO-to-Transmitter coupling

Yahoo group: AWAGroup (2010 — 2011)
Date: 2011-01-12 00:21:08 UTC
From: Roger Kuchera
Topic: 1644 Message: 1644

Gentlemen,
There is an excellent article covering various methods of coupling to several different types of xtal oscillators from a VFO in the 1946 ARRL Handbook. It has schematics and descriptive text on pages 295 and 296. If need be I can scan it and send it along. It is printed on old wartime paper and the pages are brittle. I will give it a go.

Speaking from my own experience, I have no trouble driving the 89 xtal oscillator stage, as a buffer, with an old Johnson Model 122 VFO. When using the VFO, I short out the 2.5 mh choke in the grid of the Tri-Tet 89. The only adverse effect I have is a very slight amount of oscillator plate current with the key up. BTW: The oscillator stage is built around a QST article from 1934. The ground between the VFO and the TX is provided by a coax cable. There is a capacitor from the plate to the output lead. No DC coupling at all. It takes just a few seconds to change back to a xtal oscillator.

What bearing this may have with a Pierce oscillator I can't begin to guess. If I can be any further assistance, Please let me know.

1647. Link Cundall contest

Yahoo group: AWAGroup (2010 — 2011)
Date: 2011-01-13 13:59:50 UTC
From: Terry Hall
Topic: 1647 Message: 1647

Good morning group,

I plan to be on the air this Saturday evening for the contest, operating portable from Pottsboro, Texas. I will be using my MFJ 9040 5 watt QRP rig and a randon wire antenna. I wish my Hartley was ready, but unfortunately, I don't have the antenna to support it right now.

Concerning the Hartley, earlier this month I posted concerns about my high SWR. I received many helpful comments, and I thank you all for your inputs. I did find that the problem will most likely be solved with a good antenna. SWR went down to 1:5 to 1 into a 50 ohm dummy load, putting out about 2 watts with a good sounding tone. I have an 80 meter dipole, and I hope to install it next week.

All the best,
Terry

I've always made my own coils for regen receivers but I have a pair of Freshman TRF coils attached to the back of variable caps. They are basket weave coils with two circuits, oscillator and tickler. the tickler is just a couple turns wound in the center of the oscillator coil.

Was wondering why I couldn't use one in a conventional two step regen, det-amp?

Ruminations welcome.

My only QSO last nite was W1ZB on 160M (the only band I tried last nite).

3 QSOs today:
40M: K4JYS and W0CWU
80M: W1ZB

Didn't have a lot of time to operate - spent most of the day cleaning up
after the snowstorm.

I've got some of these coils (loose, without the condensers), as well as a
Polydyne (= Freshman Masterpiece) that uses them.

No reason why not, but if you are going to use the primary as the tickler,
it would be indeed be serendipitous (sp?) if the number of turns worked
out. You may need to wind your own tickler. You may be OK using the
primary for antenna coupling, but it may couple too heavily for good regen
performance. In either case, it's worth trying, and please report your
results here.

Larry,
I always assumed the detector in a TRF set was regenerative. Guess not. So the green DSC wire with a few turns is the primary not the tickler. I knew that was the case for the RF stages but just always thought the detector was a regen..,.

Adding a tickler winding to the TRF coil is a good idea and it's easy to do. Using the primary as the ant winding should work fine if I add a coupling cap of a few mmf between the coil and ant like on the Doerle Signal Gripper.

Gentlemen,

I managed a couple of QSOs in the last hour of part 1 of the Linc Cundall test and the reports I received were all good ones. A bit later in the evening I got on again and worked a non-AWA station who reported my signal was unstable and nasty sounding. I hope the AWA members I worked weren't blowing smoke when they gave my signal report.

I go to great lengths to put a nice, clean signal on the air. I tried listening to my own signal with a CW monitor and it sounded OK. So I am at a loss.

I plan to be on for part 2 Saturday/Sunday and would appreciate any critical comments on my signal that you might have. Thank you.

Hi Roger,

When I worked you the other day your signal "...lapsed" into a couple of VERY brief, intermittent states of unsteadiness, with just a touch of raspiness...I never said anything, because for all I knew, you may have inadvertently bumped your transmitter whilst transmitting.

Otherwise, I would have SWORN you were running a modern rig! Seriously.

I'm sensitive to such things, because I've been fighting a battle here with a similar affliction plaguing my 45 year old Drake T-4X transmitter.

Again, the raspiness/instability on you was VERY brief, VERY intermittent, and VERY rare---for 99.9% of transmission you were really and truly "599X" here...

Hi Roger,

I haven't worked you yet, in the LC, but maybe this coming weekend. I have found that sometimes listening to my signal with a good local rcvr does not always tell the true story. Sometimes overload causes weird sounds. I sometimes use a TS-440S (w/no antenna) as a CW monitor and on occasion, the signal has sounded like it had some AC on the tone. Listening on another rcvr, the signal sounded ok. If you have a computer at your operating position you might try tuning your signal in using the WB4MAK remote rcvr at http://wb4mak.com/ The rcvr is in Atlanta, GA. Other remote rcvrs are at this link: http://www.websdr.org/ . I haven't actually listened to my own signal, but have heard other signals and it works pretty well. I have also noted that many new ops (and old ones too) aren't very familiar with the true use of the RST system..RST 599 is about all they seem to know now days. I have had many of them not mention my chirp or will give be a bad 'T' report because I had some chirp, but the tone was good. Oh and have found some are overly critical of a very slight chirp or AC on the note. If I really want a factual report I usually will ask another BA or vintage enthusiast.

Good luck and if you use the remote rcvr, let us know if it worked.

Nope - the typical 3-dialer, Freshman Masterpiece included, had a
non-regenerative grid-leak detector, so no tickler winding on the coil.

Subject: Re: [AWA Group] Possible problem with my '34 TX?

Hi Roger,

When I worked you the other day your signal "...lapsed" into a couple of VERY brief, intermittent states of unsteadiness, with just a touch of raspiness...I never said anything, because for all I knew, you may have inadvertently bumped your transmitter whilst transmitting.

Otherwise, I would have SWORN you were running a modern rig! Seriously .

I'm sensitive to such things, because I've been fighting a battle here with a similar affliction plaguing my 45 year old Drake T-4X transmitter.

Again, the raspiness/instability on you was VERY brief, VERY intermittent, and VERY rare---for 99.9% of transmission you were really and truly " 599X " here...

Subject: [AWA Group] Possible problem with my '34 TX?

Gentlemen,
I managed a couple of QSOs in the last hour of part 1 of the Linc Cundall test and the
reports I received were all good ones. A bit later in the evening I got on again and worked a non-AWA station who reported my signal was unstable and nasty sounding. I hope the AWA members I worked weren't blowing smoke when they gave my signal report.

I go to great lengths to put a nice, clean signal on the air. I tried listening to my own
signal with a CW monitor and it sounded OK. So I am at a loss.

I plan to be on for part 2 Saturday/Sunday and would appreciate any critical comments on my signal that you might have. Thank you.

CUL, Roger/K1TG

Yes indeed, on so many levels.

With apologies to HPM, today's "Rotten Radio" letter...

Rotten DIGITAL MODE

By “The Old Man”

This DIGITAL MODE business is getting my Nanny. Here it is midnight, and this msg. from a fellow whose girl has not had a letter from him for a full twenty-four hours, is still stalled. I have smoked myself into a state of funk, the floor is covered with burnt matches, I am losing a perfectly good temper, and there is no sign that this will not continue all night long. How long do these radio bugs sit up at night any way? Right now, as I write, there is that old gink 2AGJ up in New York State fluttering along with that bird –in-the-cage spark of his, 8YO is yelling his darned head off for somebody over on the Pacific Coast, apparently, 8NH is still trying her best to be ladylike in spite of a full hour of trouble, old 8AEZ is booming out QSA but DIGITAL MODE bad CUL, 9PC is trying to do something to 5BV, I distinctly heard 4DI say a bad word, and to the best of my knowledge and belief, no one has got anywhere.

What are we going to do about this business? It used to be that we were perfectly satisfied to listen to SLI and once in a while on Saturday night when we could stay up late, we would listen to Arlington send time. When heard some commercial say DIGITAL MODE, we had to look it up on the chart to see what it meant. Later, we began talking to the fellow over on the other side of town and then was born amateur DIGITAL MODE. Sometimes, the “little boy with the spark coil,” (the latter is all right, but dog gone the hide of the former) would try to call us at the same time, and we used to think we were in trouble. Still later we used to think we were bothered when we were in the middle of a “conversation” with a fellow in the next town, and some whop would butt in. It about this era that we began to organize Radio Clubs, with high faluting ambitions about “promoting radio communications and controlling interference.”

But when we have a fellow who has not written to his girl for a full twenty-four hours, and who positively must get the msg. to her over in Illinois, it becomes a serious matter to have some one else getting gay with the ether, especially when the later had no conception of the existence of the word “brevity.” One thing I will say, and that is that good old 8AEZ is brief. His spark may drown out every-body in the western hemisphere when he sends, but he is brief. He says what he has to say in a few words in a few signals and he stops. He also does not go in for the long technical discussions about gap speed and condenser construction while forty or fifty others of us are waiting with five or six messages each, many of which have been stuck on the pin a week. Far be it from even me, a real blown-in-the-bottle radio grouch, to find any fault or mention any names, but some of the young gentleman who burn up my valuable time every night and thereby multiply this DIGITAL MODE business, ought to look up in the dictionary the definition of that particular combination of letter indicated by B-R-I-E-F. I could call off a dozen of them right now, and I would if I thought that Editor down east would print them.

The trouble is, the young squirts don’t stop to think. They start out and call somebody somewhere every three minutes. Everybody they hear, they immediately call. If they don’t hear anybody, they send a QST something like this: -- QST QST QST QST QST QST QST de 1NUT 1NUT 1NUT 1NUT 1NUT 1NUT 1NUT 1NUT 1NUT. Any station more than fifty miles distant hearing these sigs. please send postal to Willie le Nut, Nutville. Willie repeats each of this msg. three times. Each letter is sent so slowly it puts you to sleep. He uses up just exactly twelve valuable minutes sending out this hogwash, and drives an old timer to the point where he radiates brush discharge from every hair on his head. These fellows ought to be limited to hours between supper time and 8:30, and any one of them slopping over ought to get a letter from every respectable amateur within his range threatening to spank him if he ever transgresses again. I know a certain some one who will put in his bid for election to the office of Chairman of the Committee on Chastisement.

Here is a sample coming in right now. Listen to this slop:-- Columbus co 2pp 18co all sigs charles 9vy u no hf a motor little heavier than the racine sorry sorry om Digital Mode Digital Mode pse qta k fish smell rotten yes yes wyd boston how do you get me gap bum bum rubber band qta pwf about motors. (Bad squeaks here. Sick spark coil near at hand. Wheezes terribly.) Want to hear tone like commercial? ark r r r yes ark r r r listen nw.

Here begins ten minutes of the darndest scratching, screeching, groaning, blowing off steam, blubbering that ever mortal ear heard. At its worst it goes on into -- -- fine fine how do u do it? ark r r r rubber band on vibrator—BANG. My friend with the one k.w. over on the other side of town explodes. He calls an 8 station. When finishes, the scratching reduces. Then we get the long distance DIGITAL MODE again. Cul om sk spfscity bunk allemo bish mela hash breakfast wunkey wunkey lala lala 2asj arm bad qsl 3zw must go to bed now hw hw hw abt abt abt msg msg msg pse pse pse k k k. This is the way my log book this evening looks. It’s enough to raise a blister on a wooden leg.

Here is another sample of Digital Mode slush:--v v v v v v v v v v---------- (Somebody sitting on his key.) v v v v v v v v v linneg se with the wlce sore feet commercial wirlih. Now what in Heaven’s name would you make out this? Is it to the effect that somebody has a line a commercial who is on the warpath for some amateur with sore feet? One cannot be sure of these matters. It might be that it is the commercial who has the sore feet, chasing down some poor amateur around town probably.

Listen to this:-- Yes yes jst wyd glucky wait a mt muddy wouff hong bliftsfy monkey motor. We assume from this msg that Glucky is being asked to wait a minute while Blifsky seeks a wouff hong with which to wallop a monkey the next time the latter faces toward the motor. I do not think I know just exactly what a wouff hong is. Probably some piece of apparatus used in the southern states to beat monkeys with.

It is this form of uninteresting “conversation” which clutters up the air with DIGITAL MODE. Of what moment is it to the rest of the world that this fellow Blifsky is going to smear somebody’s monkey with a wouff hong? When anybody relapses into such mental slop as to want to operate with a thing named a “wouff hong”, he ought to keep his trouble to himself and not compel all of us respectable amateurs to listen to his drool. To slaves and slobber a lot of foolish twaddle like this when that poor girl out in Illinois has not had a letter since yesterday, is plain wicked.

Sorry om Digital Mode Digital Mode 9vy few words schlipsh nuzzle his mucket faded undershirt cfrish reptg pain in neck sus gup om cul ark. This is a real relay, evidently. 9VY over in Fort Wayne is mixed up in it in some way. Whose undershirt they are talking about and what schlipshing one over is, I do not know exactly, although I have a rough

idea. Whether the signals faded or the undershirt faded, or what was the matter with the sus gup of the neck of the undershirt, I be darned if I know.

Just cast a lingering look at this:-- Biirgrmp bru rotary ge ge ugerumf om with my set rettysnitch spitty tone hit in potimus? Now what do you suppose the poor gink was trying to say when unreeled that? You have to guess a lot in wireless, and how would you guess this? Something is wrong with this fellow's biirgrmph, his rotary also has a bad case of ugerumf and somebody around the place must have spit on his rettysnitch, because his tone was so rotten it hit him on his potimus. Sound bad to me. Why will some people send such personal matter by wireless when the whole country can overhear it. It isn't decent, and it makes the DIGITAL MODE more rotten than ever, and just think of the way it makes a perfectly good log book appear.

I spent the better part of an hour trying to make out what ailed the poor fellow's biirgrmpg, but had to give it up while I listened to a child with a spark coil scratch out this at a rate of around three words a minute:-- how do s…….e…….? how be …..? how do I cowp ……. cw ….v v v v v v ---------- come in ? ? ?ark After a long wait another trouble maker with a bad cold in his head stumbled back with:-- r r r r r r r r r r r r r ok ok please ? ? ? ark Another pause followed by the first little demon with:-- r r r r r r r r r r qta qta qta pse rat . . . . . ve . . . . . .? pse ttt . . . . . .qta pse repeat ark. These brats kept this up for twenty minutes and they ended up just where they began.

What we ought to do is organize an Anti DIGITAL MODE Association. Then let us elect for Chairman the worst plug-ugly we can find in these U.S.A. Then let us chip in for a little money and hire a clerk with a bad disposition who will write letters threatening the life of everybody whom the members report as causing needless DIGITAL MODE. If anybody gets balky, we will all join together and swear the gink is sending with a decrement greater than two-tenths, and so report to the local Radio Inspector. If the latter does not within twenty-four hours have the boy arrested and sentenced to life imprisonment, we will all band together and find another job for said Radio Inspector. Let us rise, fellow bugs. Rise and crush this octopus which is engulfing and overwhelming us. Eight hours a day and triple time for overtime is death and starvation to our families. Hash for breakfast, rotten smelling fish, and DIGITAL MODE -- -- -- We will have naught of it. Down with the fellow with the scratchy spark coil, down with the fellow who calls three times three, down with the fellow who calls everybody he hears and down down down with that unspeakable skunk who calls somebody and sends a long relay message repeating each word three times when the station to which he is sending is sending something himself.

There by heck, I have that off my chest. Now you there in Illinois, get this call. Let everybody else stand back from now on. I'm tired and sleepy and cross, and I don't care who I DIGITAL MODE until I get that pin cleared off.

-The Old Man

Will the 6L6G XMTR double to 20M?
Regrettably, no. I rigged up a 20M tank and although it oscillates there is no power out. Old rule of thumb, odd number of tubes produces odd harmonics, even numbers even harmonics. Now if it were push-pull..... 8^)

I'll be on this afternoon and part of tomorrow with the '34 rig.
Will start on 40 mtrs, 7112 & 7120, then move down to 3567.
With about 15-20 watts out.

For the local guys I can fire up the little 6N7 Jones push pull rig on 160 mtrs, 1814 & 1820 I think. this will be QRP 5 watts.

Hi Dan!

A single-ended stage run heavily into class C produces both even and odd harmonics. Push-pull stages only produce odd harmonics, though, and push-push stages even harmonics I can't recall for sure if push-push stages create odd harmonics - but I'm thinking not).

But, if your 6L6 xtal oscillator is simply and XTAL in the grid circuit, and a parallel LC tank in the plate, I don't think you can get any frequency multiplication in the plate circuit. I believe this to be so, but I'm not sure why.

However, adding a low Q LC in the cathode tuned at approximately 1.5X the XTAL frequency will transform it to a tri-tet oscillator, which allows doubling, tripling, and (if you're lucky) even quadrupling in the plate circuit. The tri-tet can be hard on XTALS, though, especially on the fundamental XTAL freq. For this reason folks learned to short out the cathode LC when not multiplying in the plate circuit, transforming it back to a TPTG XTAL osc circuit (if you will).

I have a breadboard tri-tet oscillator rig I built which will take a type 59 or 1625 tube - the latter requires a jumper wire from the pin which would be the 59 plate to the 1625 plate cap. I used it (as a straight-through XTAL osc.) to talk to Jerry W1ZB on Link Cundall Wed. nite, putting out a mighty 3W to the antenna with a 59 in the socket. I have it set up with a selector switch to short out the cathode coil, or to select taps on the cathode coil for 160M, 80M, OR 40M XTALS when multiplying.

1680. New 1929 builder seeking guidance

Yahoo group: AWAGroup (2010 — 2011)
Date: 2011-01-15 19:34:30 UTC
From: N1BUG
Topic: 1680 Message: 1680

Hi folks,

I come in search of wisdom. My long dormant interest in building a 1920s style ham station has been rejuvenated by a friend. But, I'm feeling a bit lost! OK, maybe more than a bit...

I have a fair amount of building experience. What I lack is knowledge of vintage parts. I want to make my rig as authentic as possible, realizing that some compromises will have to be made due to certain vintage parts being about as easy to find as hens' teeth.

I have a couple of challenges that are immediately apparent:

First, I went through my junk (er... stuff) and found a few items which may or may not be appropriate for use in such a project. Specifically, a vernier drive and a panel meter. I know they are old, but don't know if these types would have actually been available in the 1920s or if they were introduced later. Short of accumulating a massive pile of old magazines or books, is there some way I can figure out whether these parts are appropriate for a "period authentic" 1929 rig?

Second, I am having a hard time shopping for parts. I'm on a tight budget and would like to avoid mistakes wherever possible. Competition is ferocious on eBay. :-) I found one potential source of parts that only offers brief text descriptions, no pictures. I'm afraid that doesn't help clueless ol' me much on items like variable condensers. Even if I know it is from the correct era and has the correct value, I have no idea whether it will fit/mount/look right in my project, since I haven't the slightest clue of its physical construction, shape, size.

I'm not sure whether there is hope for me with this project, but if anyone has any helpful tips I would be most grateful! I really want to build this and get it right!

Hi everyone,

I have been putting together the knowledge and parts necessary to build my first '29 TNT transmitter. Joe N2OUV has been an awesome Elmer to me during this process. I have been having difficulty locating the 100 ohm center tap resistor and he mentioned that another method they employed in the 20's was using Christmas tree bulbs in place of the resistor.

First, has anyone tried this? If so, do you have any pointers. This sounds really unique and, frankly, kind of cool.

I hope everyone is having a great year so far.

Now that's a heck of an idea! I would never have thought of Christmas
lights. Has anyone put the filament voltage across two in series and
measured the current? R=E/I? The little 7-watt light bulbs for night-lights
might work too. Time to experiment!

Here are a couple of webpages to start you out.

Steves website can give you alot of insight into building a 29 transmitter.

http://members.shaw.ca/ve7sl/tnt.html

Here is a transmitter article I wrote for the Antique Wireless Association Journal.

http://www.antiquewireless.org/otb/hartley0709.htm

It is a fine low cost transmitter that can get you started. I would recommend you build a transmitter with what parts you have, learn from it, then add period parts as you find them. I only mention this because it took me a year to collect the parts for my first transmitter. In hindsight I should have built up the tx with whatever parts I had on hand, put it on the air and enjoy it, and then insert period parts as I came across them.

The Hartley transmitter may be the simplest transmitter to build, with very few parts. Many guys are building TNT (tuned not tuned) transmitters, some TGTP (tuned grid tuned plate), and a couple of oddball guys like me and Eddy VE3CUI running Colpitts transmitters.

If you belong to the ARRL you have unlimited access to their PDF archives of QST back to 1915. I've spent alot of time going through QST from the late 20's to the early 30's where all these transmitters are talked about.

Tonight I was on the air with my 1929 Colpitts transmitter and participated in the AWA's Linc Cundall OT contest. I was running 10 watts and listening with a 1941 National HRO5TA-1.

73, Scott WA9WFA

1690. Saturday Linc Cundall Comments

Yahoo group: AWAGroup (2010 — 2011)

From: whitebear1122@comcast.net
Topic: 1690 Message: 1690

I was able to work some Linc Cundall guys on 80m tonight. I think my farthest contact was AC5JH in Oklahoma, wow! I heard but did not work W1GIG, KB0ROB, and one other that I don't recall. I was on for several hours but didn't hear too many stations. W0CWU was sounding FB at my qth with his 50 some watt MOPA. I am hoping to work some more guys in the morning. It was nice working Ed at the AWA headquarters W2AN station.

I started out using the 1929 210 push pull Colpitts transmitter and the 1941 g.HRO5TA-1. During the lulls I worked on the Gross CP-100/VFO situation and finally made some progess after realizing there was a neutralization problem between the oscillator and buffer stage. I didn't realize Once I cleaned that up the VFO appeared to work ok. I was able to move around the entire 80m band FB. I hooked up the Gross CP-100 and ran 50 watts for several contacts including Lou VE3AWA, Ron N4GJV, and Tom AC5JH. I wonder how the Gross sounded to those guys. I'm thinking tomorrow of replacing the HRO with the 1934 NC-101X and run a full 30's station.

I'm thinking of looking for a Millen 90711 vfo as it covers 80m, 40m, and 20m. My vari-arm is 80m only. It does do 40m if you open the coupler and unsolder a connection. If anyone has a nice shape 90711 that they would like to sell, please contact me.

I'm planning on leaving the Gross/NC-101x station hooked up for contacts all year long. Let me know on the 90711.

GM Gentlemen,
Apparently no AWA members were on 40 last night, at least that I could hear. Lots of RTTY above 7040. I got some of it out with the xtal filter in my FBXA but some were very strong and swamped the front end. I called AWA de K1TG for about an hour and half and got no answers.
I'm going to try some daytime calling and see if I can scare up anybody.

I can't be sure but I may have found my instability problem (?). It appears as though the shaft of the tuning knob was making an intermittent ground by grounding through the front panel.
I solved this by using Greenlee punches to enlarge the front panel hole.

If I work anyone, PLEASE give me a critical report. Thanks.

CUL, Roger/K1TG

I'll be on 40.

Hi Roger,

"...It appears as though the shaft of the tuning knob was making an intermittent ground by grounding through the front panel. I solved this by using Greenlee punches to enlarge the front panel hole..."

A VERY slick way to solve any intermittent grounding problem(s) of metal shafts going through front metal panels is to use an ordinary 1/4" phone jack as a panel bearing: just be sure that the centre conductor of the jack is shorted to ground, & you're A-OK (the centre jack pin applies constant pressure to the shaft, effectively ensuring a good friction ground that continually "...rejuvenates" itself by virtue of the knob being twirled/twiddled).

BTW, this is an old Bill Orr (W6SAI) idea, gleaned from the pages of a late 70's issue of HAM RADIO magazine...I take no credit for it whatsoever, merely the benefits of applying here in my own HB creations.

Hi Paul,

Well, I wouldn't be all that hung-up on having everything in your future project "...100% vintage". To do so would probably preclude you from ever building anything that might replicate that era!

I, for one, did not hesitate to add an SO-239 connector to the back of my 1923 Colpitts rig---it facilitates incorporating its use in my station (although I'm sure such blasphemy would make others cringe at the mere thought! Hi Hi).

My suggestion to you would be to "...casually" construct a vintage self-excited transmitter at first, one that at least captures the "feel" of the era. Once you've cut your eye teeth on that project, you can then devote time & resources toward the construction of a "perfect" 1929 time machine...

But at least you'll have the "mongrel" rig to serve as a daily, hands-on inspiration...

Roger,
the contest rules specify 7030-7050 as the operating freq which I didn't see
till after I made that post. I only have vintage Bliley crystals for 7112 & 7120
and of coarse I didn't get any responce up there. I ended up using some newer
crystals (smaller) and was able to put out a chirpy sig. Made one contact
then gave up trying to fight the digital crap. QRM is terrible in that portion of
the band, tho the upper portion appeared relativly clear.

Maybe someone should consider a different freq range for 40 mtrs next year.

Was on 3567 for about an hour but couldn't raise anyone. Even tuned around
to see if someone with an xtal TX was responding, nothing. I did hear some
faint signals from a self excited TX but couldn't make it out. Maybe VA3AWA
and the TPTG rig?

Hi Eddy,

Nice to hear from you!

Maybe I should explain my goals a little better. I know there are some places I'm going to have to compromise and use modern parts (hopefully disguised to look like period parts). But, as much as possible, I would like to capture the look and spirit of a rig actually built in the late 1920s. For me, that means I don't want to use a style of condenser, for example, that wasn't invented until the 30s, 40s, 50s, unless absolutely necessary.

I don't mind so much that I will probably have to hide modern resistors in some sort of home made "encapsulation" for the center tapped filament resistor, or create a grid leak that looks like the old ones (both ideas I got from VE7SL). However, I will search to the ends of the earth for d.c.c. or d.s.c. wire for winding the grid coils and choke before I will give up and use modern enameled wire. :-) Likewise I intend to search long and hard for old beehive insulators before I give in and use something else. :-) To me those items are a *major* part of the "look and feel" I am chasing.

That said, however, I may do as you suggest and build a "mongrel" rig at first, then rebuild it later when I come up with the parts I really want.

By the way, my intention is to build a '29 TNT rig first, soon followed by a 20s regen receiver. I'm still trying to decide what receiver, but "A Simple 1750- and 3500-Kc. Receiver" from November 1929 QST looks attractive as a starting point. I can always build something more sophisticated later.

I will probably use an '01A tube in the TNT at first, because I can afford one. At some point I think it would be nice to upgrade to a '10, or perhaps a '45.

I got no sleep last night! I was too excited! Early in the evening I heard some '29 rigs on the air! That was a first and and huge thrill for me! Specifically, WA9FWA, N9HAL, and N4GJV (Ron was the one who rejuvenated my interest in vintage rigs).

Hi Scott,

It was a thrill to year you on 80 meters last night!

Thanks for the references and your article. I did see those, and followed all the links I could find, before checking in here on the group. I'm now wading through the online QST archives for articles and information.

I noted in your article on antiquewireless.org you aren't using the center tapped filament resistor or the two .005 uf condensers across the filament. I assume that is because the '27 tube has an indirectly heated cathode. Please correct me if that is a bad assumption! Your circuit has the lowest parts count I've seen so far. I do admit I'm leaning toward sticking with 4 pin tubes, only to create an easier (less modification) upgrade path, but your circuit is intriguing.

Time to get back to mining tidbits of info from the online QST archive. :-)

"I, for one, did not hesitate to add an SO-239 connector to the back of my 1923 Colpitts rig---it facilitates incorporating its use in my station (although I'm sure such blasphemy would make others cringe at the mere thought! Hi Hi)."

I, for two, feel the same way. I have a pair of banana jacks or a pair of fahnestock clips with a 3/4" hole spacing to take an SO-239 rigged with a pair of banana plugs with the same spacing. That way the "purity" (?!) of the rig is unsullied while I can still connect it easily to the "real" world.
*
My suggestion to you would be to "...casually" construct a vintage self-excited transmitter at first, one that at least captures the "feel" of the era. Once you've cut your eye teeth on that project, you can then devote time & resources toward the construction of a "perfect" 1929 time machine...

Thanks for all the great responses to my first post!

OK, here are some parts I am trying to date. I know these look terrible but I hope I can clean and restore them with a little effort. What I want to know is which of these (if any) were available in 1929?

http://www.n1bug.com/all.jpg

The vernier is a National velvet vernier, 4" diameter, bakelite.

The meter is a Jewell (actually this may not be right for my project in the end, but does it appear to be old enough?)

The lighter brown mica condenser is a Sangamo CM45 type and the darker one is a Solar.

Glad to see your interest, Paul. My first '29 rig was the TNT from Dec 1929 QST. I used a '01A with fairly low plate voltage at first, but later got brave and now run it with a little over 200vdc. It works nicely even at the low power. The first year I used it in the '29 party it ran around 2w input and I made around 18 contacts...the most fun I'd had in ham radio in a long time. Go for it with the '01A...you can go QRO later with a '10 or other available tubes. For the last two years, I have used a '29 Hartley with a '10...QRO is fun too...hi.

Paul -

I believe that all the parts are pre 1929, with the exception of the light brown mica. Regardless, it would not matter if you used it. How many people make large diameter copper coils for their transmitter with old copper? The idea is to make it look old, but, you are still building it today, and, even using modern solder, HI. 73 - Mike

Hi Paul: I just grabbed a few later month QST's from 1929. The Jewel meter is advertised there, as are the Sangamo caps, not sure of the Solar. The 0-180 degree knobs are in common use as are vernier movements, but not necessarily those by National. So ur good to go. Don't get to hung up on exact parts from 1929, as long as they represent items from the era. Don't use off shore parts though - hihi. Good luck with your projects.

Looks good to me. The mica caps should still be good unless they were arced through. Check them with a "C" meter.

From: dpetersen tds.net
Topic: 1722 Message: 1722

I just pulled out the old photos of the 1945 6L6 rig and added the newer ones - the ones that had the glaring wiring errors. I found room for the antenna loading variable and fixed the errors.

Hi gang: Dr sez he thinks I am gonna live. Lets hope.
Friend of mine needs a 5 pin tube socket, either wafer type or plastic so he can make an adaptor.
I am willing to buy, beg, bum, rent or steal one. Anybody help?
I have just completed scanning an 87 page catalog (plus covers) and stored in both JPEG and ,pdf.
It is titled:
Short Wave Apparatus
Kits Parts Data
By
Radio Engineering Labratories
Long Island City N.Y.
March 1 1928
Here are the first 10 pages in JPEG
http://img.photobucket.com/albums/v618/skyrider28/REL-1.jpg
http://img.photobucket.com/albums/v618/skyrider28/REL-2.jpg
http://img.photobucket.com/albums/v618/skyrider28/REL-3.jpg
http://img.photobucket.com/albums/v618/skyrider28/REL-4.jpg
http://img.photobucket.com/albums/v618/skyrider28/REL-5.jpg

Hi Paul!

That National Velvet Vernier I would think is pre-1929.

The meter and micas may or may not be, but for my purposes would be
close enough to be considered "period."

By the way, I'm down here in Gray, and your call sounds vaguely
familiar. Have we met?

If you have 160M capability please join us for the Monday nite AWA net
on 1.945 MHz tonite at 8:00PM, N3IBX presiding. LSB or AM accepted.

73,

Anyone wanting to respond to the 'How Old Are These' thread should use this new subject header. For some reason, Yahoo's spam filter has trapped every single one of the 'How Old Are These...' mails as possible spam....must be some wording in the header that triggers their filters. This requires the messages to be approved and sent on again to the the group....hopefully this new header will hold up!

Steve / VE7SL

Oops! Sorry tor the extra work Steve.

A big Thank You to all who have replied with help and info. What a helpful, friendly bunch of folks!

I am well on my way collecting parts, and keeping busy mining available resources for knowledge.

By the way Steve, I tried replying directly to you the other day to say thanks for the invitation and to ask a couple of questions about your '29 construction, but your ISP doesn't like my outgoing mail server. :-) Anyway, thanks!

1730. LC Contest de AC5JH

Yahoo group: AWAGroup (2010 — 2011)
Date: 2011-01-17 20:26:02 UTC
From: Tom
Topic: 1730 Message: 1730

Howdy to the group,

Operated a little of the LC event Sat evening and Sun morning. Worked Scott WA9WFA in MN and Ron N4GJV in NC Sat evening and Tony K0KCY Sun morning. Was xtal bound and would have liked to have had more time to operate.
It was fun and my 6a6 Jones P/P exciter and HQ129x worked out well for me. I posted a pic on my operating set-up in the Photos section under AC5JH if you would like to take a look. I think I will leave it set up for a while and play with it some more. It tunes nearly 5 watts on 80m with a nice cw note on most xtals.

Great fun and hope to get in on more of the fun in the future.

Tom AC5JH

I'll put up some condensors for dating. If the pic doesn't show up in my message, check the Pictures file under my call - KK7UV.,

One is a Dubilier condensor. 1.0 mfd., D.C. WorkingVoltage 160, brass plated case, potted with tar.

One is an ACME Wire co. PARVOLT condenser, 1MFD 200 volts D.C.

One is an Illini mica condenser.

1733. RE: [AWA Group] 1929 parts

Yahoo group: AWAGroup (2010 — 2011)
Date: 2011-01-17 21:02:09 UTC
From: Bauman, John
Topic: 1731 Message: 1733

One thing to remember when selecting parts for a vintage set is
many parts that were designed and mfg'd in the 20's and 30's were
carried over to the late '40s and early 50's without any change in
the basic look. National dials for example, the B, BW and N dials
stayed the same for decades. I have WWII war surplus mica caps
that look just like those made 15-20 years earlier except for color
and a few additional markings. Cardwell variable condensers have
the same construction from the '20s to the '50s. It's Difficult
to tell some Jewell meters from the '20s, '30s or '40s.

So, if it looks like a part made back then and it works, who cares
when it was actually made?! I know I don't.

Paul, I'm like you, I'm on a limited budget too. It's the look and feel
of a vintage rig you're trying to capture. Using real old parts isn't always
a good idea either, I had some antique mica caps go bad in a vintage
transmitter I built and burned up some other parts when they shorted.
I could have used some newer but old looking parts that wouldn't have
shorted but no I had to go with the genuine thing and ended up replacing
two antique mica caps and two chokes. Oh well, I learned my lesson.
I use newer but old looking parts and test those subject to stress.

Or you can be like Steve, VE7SL and roll you own vintage parts... He's
got way too much time on his hands!

> when it was actually made?! I know I don?t.

Nor do I, as long as it looks like it might be from the '20s. As you said it's the look and feel I'm trying to capture. My problem is I've not seen enough *good* pictures of real vintage rigs and parts to have a solid feel for what styles of parts were around then. I'm slowly coming up to speed on it, though. The more clear pictures of genuine '20s stuff I can find, the better.

> I had some antique mica caps go bad in a vintage
> transmitter I built and burned up some other parts when they shorted.

Ouch, sorry to hear that. That sort of failure gets very ugly when they are in a high power circuit. Don't ask how I know...

> Or you can be like Steve, VE7SL and roll you own vintage parts? He?s
> got way too much time on his hands!

But he does nice work. I admire his ingenuity on that center tapped filament resistor. I keep asking myself if I feel clever enough to have a go at that. ;-) I strongly suspect building the resistor isn't the trick... it's making that plexiglas form!

John, I enjoyed seeing your work on Steve's site and elsewhere too. Nice old style tube in your Hartley!

"My problem is I've not seen enough *good* pictures of real vintage rigs

and parts to have a solid feel for what styles of parts were around then."

Well yes, that's part of the learning curve.

What helped me, beside going to antique radio swap meets, was when I bought

a large lot of QST's from the 1920's and '30s. Between two purchases I had

almost two decades of excellent info. Nothing like holding the original

article in your hands. I can make better scans then what you usually find

online too.

Thanks for the comments on the 845 Hartley. Tho, I think this tube is giving

me fits. The TX goes spread spectrum when the voltage is cranked up. The tube

was free so I'm not complaining just stating facts.

Looking for a reasonably price 211 to try in its place. "Hey buddy, can you spare a 211?"

Yeah, both Steve's (VE7SL & KK7UV) do nice work. And here's another site to

inspire you Paul,

http://www.sparkbench.com/homebrew/homebrew.html

Be sure to view the second page. Bill does excellent work and if he can't find

the part he usually makes it out of ordinary everyday material.

Cardwell variable condensers have the same construction from the ‘20s to the ‘50s. But, I believe the hard rubber insulator bar was replaced with isolantite or ceramic at some point.

It’s Difficult to tell some Jewell meters from the ‘20s, ’30s or ‘40s. The 20’s Jewell have the exposed screw on the glass face and the rear mounting screw. Later Jewells wrapped the bakelite bezel up around the screw and I think they went to panel mount (front bezel) only.

I had some antique mica caps go bad in a vintage transmitter I built and burned up some other parts when they shorted. The larger Sangamo caps can be hollowed out underneath (when they’re bad) with a Dremel and a modern cap tucked away in the cavity.

He’s got way too much time on his hands! This from a guy who has built at least 15 rigs this winter?

Cheers, Steve KK7UV

Great stuff! I found a couple Silver Marshall power supplies (models 669 and 675) listed there which are very similar to the S. M. model 670 "Reservoir Power Supply" I had purchased at last May's Deerfield hamfest (for $5!).

I need to spend some more time up on Lloyd's site.

Kudos to Lloyd KK7IZ for providing such cool and useful resources!

When they call the roll in the Senate, the Senators do not know whether to answer "present" or "not guilty." Theodore Roosevelt

Hi Everybody,

On Feb 24th QCWA Chapter 154 in West Palm Springs is celebrating Leo's 100th birthday. For those that don't remember Leo owned and operated World Radio Laboratories in Council Bluffs, IA for many years.

So here's the plan, take a QSL card, write 'Happy 100th Birthday Leo' on it and send it to:

Leo Meyerson, W0GFQ
19 Park Lane
Rancho Mirage, CA 92270

Gene Pentecost, President of Chapter 154 will make sure they get to the party so everyone that attends can enjoy them.

One last thing, tell every ham you know to do the same thing, QCWA member or not. Spread the word, at every radio club meeting you attend, at every net you check into.

I want Leo to get hundreds, maybe even thousands of cards.

tnx es 73,
Bob Roske, NØUF
QCWA President

Thanks Lou,
Yep, bruiser is a good word to discribe that power supply. No, I did not build it, Wes W5DPM built it about 15 years ago. He always encouraged me to "embrace the power supply" and they were one of his favouite things to build.

I herd you and GIG in qso the other evening but was not able to raise either of you. Working on a 29 rig so mayby next time.

16 Nov 04 23:13
Back in the days before EPA, wrinkle finish paints used to be available in colors other than black. I used to have a formula for a homebrew version of wrinkle paint that used readily available materials but I have lost track of it over the years. Does anyone else out there have a workable formula?

17 Nov 04 15:57
Try adding Tung Oil to your paint. Tung oil encourages wrinkling because the mid-layer of paint does not dry as fast as the top. Wrinkling is caused by uneven drying between the substrate, mid, and outer layer of the paint film.

Larry -

Yes, pretty much, based on some of the other items in the catalog. Possibly even 1930, but, certainly that vicinity. In either case, I am pleased with the receiver and lucky enough to have 4 coils for it. I had not known it came as a kit. I had always thought the crudeness meant someone played with it, but, more than likely, knowing what I do now, it was just not built with that much care. Thanks & 73 - Mike

Lou

Look inside the front cover. First ed 11-2-1926, 2nd ed 3-1-1928.

There are other dates penciled thru the catalog.

I believe the catalog was originally issued, then revisions and supplements were mailed later,
to be added by the holder, where he penciled in notes and dates. Some of the pages have 2 creases across them as if they had been folded and put in an envelope. Also the page numbering sequence is off.

My guess is the catalog spans 1926- 1931/2.

From: Don Buska - The Radio Lab Works
Topic: 1760 Message: 1765

I've grabbed all 91 pages from the Photobucket that Lloyd posted to. Thanks Larry for the heads-up. I now have it all in MS Word and will print it out. I have an original of that 2nd edition Short Wave Apparatus catalog (that 1928 2nd edition with nothing added and it is only 30 pages long and all the pages, except the cover, have the lined border with the REL logo in all four corners. I think that border will also aid in dating those non-bordered pages to determine if they eralier or later releases. BTW, the page numbers in my original jump all over the place too. So around 60 of those pages that Lloyd posted are probably part of a another catalog or as Lloyd has indicated they were sent as fillers. It looks like REL just grabbed pages that applied to existing products at the time they released a catalog and removed pages that were for discontinued items. Mine had their Deluxe receiver, but not the Amateur Band Kit Receiver. So you get this jumble of product pages depending on when they sent the catalog. My 2nd edition starts on page 5A.

I'll print out the 91 pages that got posted and pull those that are part of the catalog I have and then see if I can piece the remaining together into another catalog or determine if they are fillers or pulls from the second edition I have. I will be able to then make them into pdf files so you don't have to grab individual jpegs online . I will post to my website and let you guys know when it's done.

Do you have photos of Wes? Lou
>
Howdy Lou,
Yes I do have a couple of pix of Wes. There is one of him at his operating position hanging in the shack.

I miss him too. We used to talk on the phone at least twice a week up until a couple days before he died. Several times we were on the phone and the radio at the same time. We would hold the phone to the receiver so the other could hear his own signals as they sounded through the ether.

The HQ-129x that I was using in the LC Contest was one that I traded him a TS-820 for.

When Wes came to club meetings, he would often have one of his recent projects in his hand. Some little peanut whistle that he had gotten to light a christmas tree bulb and had listened to across the room. He always gave it and a good story to someone before he left. He really embodied the Elmer sperit of Ham Radio. Yea, I miss him a lot, he was a good friend.

1775. REL Documents Completed

Yahoo group: AWAGroup (2010 — 2011)
Date: 2011-01-21 19:47:28 UTC
From: Don Buska - The Radio Lab Works
Topic: 1760 Message: 1775

OK Guys I think I've got it done now.

After printing out all the pages that Lloyd KK7IZ provided I was able to make some sense of it all, at least I think I did. These pages originally came from three separate documents.

REL Short Wave Apparatus, First Edition 1926
REL Short Wave Apparatus, Second Edition 1928
REL Modern Short Wave Apparatus for Exclusive Amateur Purposes 1928

REL released their stuff in folders that were held together using brass fastners through two hole punched pages. This was an easy means for manufacturers to supply supplement or page changes for their catalogs to end users or jobbers (distributors). Plus it saved on printing costs - only pages got changed and not full catalogs. However, it dawned on me that this method may not be the best for us collectors, as old obsolete equipment sheets may have gotten thrown away. That's great if your selling the stuff new, but not so good if we find one of these items and need to obtain the original documents. Obsolete equipment pages become rarer to find.

Many of the original pages posted by Lloyd had the REL address of "27 Thames Street" in NYC. REL moved from that address to "100 Wilbur Avenue" in Long Island City in early 1927. The address change happened between April and May 1927 in QST. So taking into consideration printing lead time I'd say they moved around March-April of 1927. Since the second edition of the REL Short Wave Apparatus came out in 1928, I grouped all the pages that had the Thames Street address into a collection and called it the "first edition" dated 1926. Even though there was no cover for the first edition in Lloyd's scans I figure they got removed from a first edition binder and moved over to the second edition in the long distant past. /My untouched second edition has no pages from that old Thames street address!/

Next I removed all the pages that had no border around the edges and determined those were part of a document "REL Modern Short Wave Apparatus for Exclusive Amateur Purposes 1928". Since the cover for that was in Lloyds scans. It also makes sense that this other document might have been combined into his binder of the second edition. These later document pages have no reference to a printing date, but based on the part numbers on the included items I placed the date at 1928.

What was left was the "REL Short Wave Apparatus, Second Edition 1928" pages. I then compared those to my second edition and they agreed 100%. True mine was missing some of the pages that Lloyd had in his, but mine also had 11 additional pages. So I added my stuff to Lloyd's

material to make a larger second edition. Lloyd's scans also had those pages with a rubber stampings over the top of some schematics that made them hard to view. My edition did not have those stamped schematics so I substituted new scans of those pages from mine (3 pages). Plus, those rubber stamps indicated "revised circuit attached" which they were not in the original scan pages.

Some interesting discoveries while doing this investigative work:

1) It appears that all REL part numbers are sequential, no matter if they are a small component or a bigger transmitter/receiver product. I think if we follow new item introductions in QST or other catalogs we could develop a time line to assign part number vs date of release. Notice the receivers and transmitters in the 1926 edition are all in the 100 part number range. When newer receivers and transmitters were introduced they moved into the 200 range as seen in the 1928 edition.

2) If you have a REL item with it's original documentation you can determine when it was sold based on the address on the documents as previously mentioned, i.e. before early 1927 or after.

3) There should be more material out there. Schematics got modified, but we have no pages showing a modified version. If we come across other originals of these documents we may find additional pages that could be added to what we have here.

4) It would be nice to find an original first edition so I can confirm that those pages I have combined as the first edition prints are indeed just that.

I have created the three documents in pdf format and they are now ready for download at:

http://www.radiolabworks.com/vintagedocs/vintagedocs.html

Naturally I'd like to thank Lloyd/KK7IZ for providing the scans and to Larry/NE1S for bringing them to the attention of the AWA Group. It was fun digging into this stuff a little and learning something new about REL.

My edition did not have those stamped schematics so I substituted new scans of those pages from mine (3 pages). Plus, those rubber stamps indicated "revised circuit attached" which they were not in the original scan pages.

Some interesting discoveries while doing this investigative work:

1) It appears that all REL part numbers are sequential, no matter if they are a small component or a bigger transmitter/receiver product. I think if we follow new item introductions in QST or other catalogs we could develop a time line to assign part number vs date of release. Notice the receivers and transmitters in the 1926 edition are all in the 100 part number range. When newer receivers and transmitters were introduced they moved into the 200 range as seen in the 1928 edition.

2) If you have a REL item with it's original documentation you can determine when it was sold based on the address on the documents as previously mentioned, i.e. before early 1927 or after.

3) There should be more material out there. Schematics got modified, but we have no pages showing a modified version. If we come across other originals of these documents we may find additional pages that could be added to what we have here.

4) It would be nice to find an original first edition so I can confirm that those pages I have combined as the first edition prints are indeed just that.

I have created the three documents in pdf format and they are now ready for download at:

http://www.radiolabworks.com/vintagedocs/vintagedocs.html

Naturally I'd like to thank Lloyd/KK7IZ for providing the scans and to Larry/NE1S for bringing them to the attention of the AWA Group. It was fun digging into this stuff a little and learning something new about REL.

Subject: [AWA Group] REL Documents Completed

OK Guys I think I've got it done now.

After printing out all the pages that Lloyd KK7IZ provided I was able to make some sense of it all, at least I think I did. These pages originally came from three separate documents.

REL Short Wave Apparatus, First Edition 1926
REL Short Wave Apparatus, Second Edition 1928
REL Modern Short Wave Apparatus for Exclusive Amateur Purposes 1928

REL released their stuff in folders that were held together using brass fastners through two hole punched pages. This was an easy means for manufacturers to supply supplement or page changes for their catalogs to end users or jobbers (distributors). Plus it saved on printing costs - only pages got changed and not full catalogs. However, it dawned on me that this method may not be the best for us collectors, as old obsolete equipment sheets may have gotten thrown away. That's great if your selling the stuff new, but not so good if we find one of these items and need to obtain the original documents. Obsolete equipment pages become rarer to find.

Many of the original pages posted by Lloyd had the REL address of "27 Thames Street" in NYC. REL moved from that address to "100 Wilbur Avenue" in Long Island City in early 1927. The address change happened between April and May 1927 in QST. So taking into consideration printing lead time I'd say they moved around March-April of 1927. Since the second edition of the REL Short Wave Apparatus came out in 1928, I grouped all the pages that had the Thames Street address into a collection and called it the "first edition" dated 1926. Even though there was no cover for the first edition in Lloyd's scans I figure they got removed from a first edition binder and moved over to the second edition in the long distant past. My untouched second edition

has no pages from that old Thames street address!

Next I removed all the pages that had no border around the edges and determined those were part of a document "REL Modern Short Wave Apparatus for Exclusive Amateur Purposes 1928". Since the cover for that was in Lloyds scans. It also makes sense that this other document might have been combined into his binder of the second edition. These later document pages have no reference to a printing date, but based on the part numbers on the included items I placed the date at 1928.

What was left was the "REL Short Wave Apparatus, Second Edition 1928" pages. I then compared those to my second edition and they agreed 100%. True mine was missing some of the pages that Lloyd had in his, but mine also had 11 additional pages. So I added my stuff to Lloyd's material to make a larger second edition. Lloyd's scans also had those pages with a rubber stampings over the top of some schematics that made them hard to view. My edition did not have those stamped schematics so I substituted new scans of those pages from mine (3 pages). Plus, those rubber stamps indicated "revised circuit attached" which they were not in the original scan pages.

Some interesting discoveries while doing this investigative work:

1) It appears that all REL part numbers are sequential, no matter if they are a small component or a bigger transmitter/receiver product. I think if we follow new item introductions in QST or other catalogs we could develop a time line to assign part number vs date of release. Notice the receivers and transmitters in the 1926 edition are all in the 100 part number range. When newer receivers and transmitters were introduced they moved into the 200 range as seen in the 1928 edition.

2) If you have a REL item with it's original documentation you can determine when it was sold based on the address on the documents as previously mentioned, i.e. before early 1927 or after.

3) There should be more material out there. Schematics got modified, but we have no pages showing a modified version. If we come across other originals of these documents we may find additional pages that could be added to what we have here.

Gentlemen,
I got this information from a very reliable source. After checking
with Norton, I downloaded it and installed it. It works like a charm.

Most people use Adobe Reader to read PDF files. but it doesn't allow you to modify the file. I came across a neat program called Nitro PDF that allows to to make entries in a PDF file or, add a signature panel, graphic, highlight text, etc. You can also convert a Microsoft office document to PDF, The free download can be found at:

1780. parts hunting questions

Yahoo group: AWAGroup (2010 — 2011)
Date: 2011-01-22 16:47:12 UTC
From: N1BUG
Topic: 1780 Message: 1780

Newbie here again...

I don't want to be a pain and wear out my welcome here but have a few questions I thought someone might be able to help with. Learning by experimentation is fun, but I need to make sure I'm buying the right parts wherever possible.

How critical is the value of the center-tapped filament resistor in a TNT transmitter? Most references say 75 to 100 ohms, but one said 50 ohms. Does the value of this resistor greatly impact note quality? If one were using two 'normal' resistors to make this, is closely matching them important? I suspect it is!

I found s.c.c. wire but not d.c.c. Any advice pro or con on substituting that? Aside from greater turns per inch, requiring re-design of coils, what other problems might I run into?

How far back do resistors made from carbon rod(?) with wire wrapped around the ends date? Were these available in the late 1920's? If so, were there obvious changes in design/construction that would give away the fact they were actually made later? I think I saw a few of these *somewhere* around here. I'm going on safari right after I finish this.

Can anyone point me to articles, hints, or anything helpful with regard to repainting markings on knobs/dials?

After finalizing an order with Play Things of Past I seem to be about 40% of the way there on the overall project (transmitter, receiver, power supplies). I spend most of my time scratching around the internet for general information relating to my project, and several hours a day panning for gold on eBay. What did I do with my time before this??? I forget... :-)

73,

Paul N1BUG

Anything in the tens of ohms to a few hundreds of ohm range will work. On the low side, you want to make sure yot are not exceeding the power dissipation rating of the resistors - The higher the filament voltage of the tube(s) you are using, the larger the resitors want to be. (P=V^2/R is a useful relationship here). You also don't want to be wasting a ton of pwoer in the resistors - I'd say no more than a couple of watts, maximum. On the high resistance end, you will be dropping B voltage across them, which will add to the grid bias and subtract from the plate-to-cathode voltage. I'd say off the top of my head for the power class of XMTRS we are discussing here, keep the B voltage drop across the resistors less than 10V or so.

> If one were using two 'normal' resistors to make this, is
> closely matching them important? I suspect it is!

Not terribly important, but the "deluxe" way to do it is to have a resistor with a variable tap or wire-wound pot, with the tap/wiper connected to ground (through the key). The tap or pot can be adjusted for minimum AC on the signal. Of course, using a pot may not be "period." So having perfectly matched resistors may not be optimum anyway, due to assymetry in the tube(s). As long as the two resistors are nominally the same value it's not something to be too concerned with. The worst thing that can happen is you'll have more AC on the signal than you'd have with an adjustment to null it out - i.e. the variable tap.

> Anything in the tens of ohms to a few hundreds of ohm range will work.

Thanks Larry!

If we figure out when they first started appearing on the scene, I found couple of the body-end-dot (dogbone?) resistors that are ~290 ohms each. I might be able to press those into service in a pinch. They are the same size, and very closely matched in value. They are a bit of an odd couple in appearance, since the shade of the paint colors varies, as does diameter of the wire leads.

OK. Presumably the B voltage drop would be calculated based on half the resistance of each resistor, since they are effectively in parallel, except perhaps for minor affects of asymmetry in the tube (which until you mentioned it I had managed to forget, again).

Lessee...

As you note below, half the cathode current goes through each resistor. So, assuming 50mA plate current and 10mA grid current (aproximate values for a ~10W input 1929 rig) we have 60mA total, =30mA through each resistor of 290 ohms. So the voltage drop will be 290 x 0.03 = 8.7V, which is a bit on the high end, but within the range I'd consider acceptable (I had said less than 10V - I won't tell you where I pulled that number from!). You may want to get your rig debugged with modern resistors of the recommended value for your design, then replace them with the old-buzzard ones and hopefully there will be no degradation in operation.

Eventually, but for now, and probably for quite some time, I'll be
running more like 2 to 3 watts input, *if* I'm lucky. :-)

Paul,

I have a vintage 100 ohm center tap filament resistor if you want it. It's a cermaic resistor.

It measures 51 ohms both sides. Should work and look fine in your transmitter. See attachment.

Would anyone have the January 1929 issue of QST and the ability to scan a page from it? I would like to read the remaining text of a small piece titled 'Tuning Arrangement'. It says continued on page 72(?), but that page is not in the League's online periodical archive. I looked at every article/entry for that month to confirm it's not there.

(?) I'm 95% sure it's page 72... the text is very blurry.

73,
Paul

Mike.....

Thanks for the article. But I'm with you re: the OM's take on television. If you can post the entire document, it would be fun to read. BTW, based on his last comments in the article.....he might have been correct in his assessment. hi hi hi

Tnx es 73 de W4MIL

Paul –

Here you go. Hope this helps. BTW, it is interesting to read the ending of an article by "The Ole Man" (HPM) about Television, that ends on the last page of the scan. Now, I'll have to read the beginning of it, HI. 73 - Mike

Hi Mike,

You made my evening.....hi hi hi

Yep, the OM certainly had a way with words. He emphasized "rotten" often...especially on CW and "rotten sending"!

I liked his use of the word "ether"....a derivative of the oft used "aether" back in the day.

The "jenkins" he mentioned certainly referred to the "Jenkins Televisor" (sp).

All in all, he had this newfangled t.v. figured out.

Wonder why he didn't mention "Felix the Cat". Probably later than his writings.

Thanks for sharing.

Fun stuff.

Hi Group:

After extensive and exhausting research I have determined that the cold resistance of a modern Christmas tree lamp (the 120vac variety) is around 290 ohms. Running in the filament circuit the lamp will hardly change from that value. Caution - your results may vary. Close cover before striking. Light green paper before throwing firework. For indoor or outdoor use only. Not to be used as protection from a tornado.

Oh, no... he's back AGAIN!

Thanks to Lou and Steve I got the info I needed on the National DX.
Now I'm trying to determine the vintage of a Cardwell. It looks
similar to the picture here:

http://www.n1bug.com/Cardwell_B_condenser.jpg

but the plate spacing is .045", 35 plates, depth 4.5", and brown
(Micarta?) insulators. I suspect this is a later model?

Sorry for all the silly questions. I'm ramping up my parts search!

The good news is my intuition and tiny bit of knowledge gained recently is starting to serve me... somewhat.

The bad news is I was right on this one.

> 35 plates... 1000mmfd.?
>
> How about a photo, Paul?

I would, but I don't have it in my greedy little paws. I was going to buy it, were it to have been a 20s part.

The owner says is measures 485 pF. I didn't do the math, but that sounds about right, give or take. This one has .045" plate spacing vs. .030" for the 480 mmfd. 21 plate B series, so it'll need more plates for the same capacity.

Enough for today. I'll be on the prowl again tomorrow! :-)

Lou,

Thanks for posting the Collins 4A schematic. The tube lineup matched my '34 transmitter I put together for the LC, but didn't get a chance to use this year :(

Looks to me like any of these used much would have suffered from the dreaded Black&Decker Syndrome. I see no way to cut off the oscillator during receive. If you were lucky enough to have a crystal on the net frequency you'd have to pull it out of the socket when ever receiving.

Niel

Antique Wireless AssociationHey guys, remember that the kind of Christmas tree light bulbs available in 1929 were not the 120 volt "night light" bulbs that we have today. They were series-string bulbs. I remember seeing them when I was a kid. They were smaller in diameter than the 120 volt bulbs, though about as long. And their glass envelopes were fluted in a manner to make them look a little bit like a candle flame. I would guess that there were 8 to 12 in a series string. I remember my Dad grumbling about the ones he still had around 1940, and wanting to get rid of them in favor of the modern strings with 120 volt bulbs that wouldn't all go dark when one of the bulbs burned out. The new ones were advertised with the slogan, "No more looking for the burned-out bulb."

One and the same! It's funny the memories Jim's message brought to mind.

Who is trying to ID that DX cap? I have several of them. I believe the insulating material is good old Bakelite or Phenolic. I have a 500 uuf set aside for the "bent" TX. That type of insulation was not the very best, which is why I may redo it with Lucite/Lexan. It does funny things at RF like leak, bubble and smell strange.

R.

From: Mike Feher
Topic: 1831 Message: 1832

As I recall, slitting the bases reduced the pin to pin capacitance and allowed the tubes to operate at higher frequencies, like even 6 meters. Whoops, 5 meters back then. I do not see how with directly heated cathodes, leaky bases would have an effect on a pure tone. 73 - Mike

Thanks for posting the Collins 4A schematic. The tube lineup matched my '34 transmitter I put together for the LC, but didn't get a chance to use this year :(

Looks to me like any of these used much would have suffered from the dreaded Black&Decker Syndrome. I see no way to cut off the oscillator during receive. If you were lucky enough to have a crystal on the net frequency you'd have to pull it out of the socket when ever receiving. Niel

Your are welcome, Niel

If I had a Collins 4A I would be on top of the world without a care certainly not about back wave! 73, Lou

now tell us what you really think Mike ;-)

Thanks Roger...I recall seeing this hint also, earlier this year when doing some late evening fireside reading. My thought at the time was similar to Mike's in that the only way this could improve the note was if his original socket had been damaged or had a carbon trace, which he removed when cutting out the bad section. It seems there where a lot of odd hints put forth in those early days when there was also a bit of black magic involved in the art of amateur radio.

From: Mike Feher
Topic: 1842 Message: 1848

Hey, why write a couple of paragraphs when a few letters will suffice? What effect could leakage from the plate to grid have? Well, for one, it could raise the grid more positive, thereby allowing the tube to go into cutoff, and preventing it from oscillating altogether. Not a PDC tone implies either hum, or, possibly chirp, but, PDC implies clean, with no modulation of AC or any other sort. If the path was strictly capacitive, then RF from the plate would flow to the grid, which is 180 degrees out of phase. That would also seem to prevent oscillation, or significantly reduce it, but, I do not see how you can go from a non PDC tone to a PDC one by eliminating this leakage path, resistive, capacitive, and more than likely if it exists, both. OK, that was more than just a plain BS reply. Excessive phase noise could also make for a lousy signal. Q does play a role here, but, again, I do not see this as a fix. Any comments? - 73 - Mike

My daughter uses the maxim "Why use one word when fifty will do." She'll call me with some request involving a time and place, then launch into a 2000 word monolog (monologue for you Canadians) about why I should remember. Remember what?

A nasty prank would be to draw a line between all the tube pins with a #1 pencil. The poor schmuck would go nuts trying to figure out what's wrong, especially if you do the same to his spare tube.... I'll bet lamp-black from a kerosene lamp would work too.
As for me I don't plan on filing a gap in any of my 80-90 year old tubes just to see if they work better.

I'd like to invite everyone to join in the Classic Exchange on Sunday. It's a lot like our Linc Cundall contest, only it usually has much more activity. You can get particulars at www.classicexchange.org<about:blank> . Call in and have some fun!

73,

Jim Hanlon, W8KGI

If the equipment is homebrew, count it as a minimum of 25 years old unless actual construction date or date of its construction article is older. This is good.

Thanks Jim. Hope to work you on 80. Lou

DX-60 and HQ-170 Novice rig, with the addition of the HG-10b for the contest. Does that qualify?

This is the rig that I have been using this month to work the SKCC K3Y/N contest. Got a 10 zone sweep with KL7 to boot. The hq-170 is in serious need of alignment but don't have the gear to get it done. Has been great fun anyway, just seemed really crowded at times.

Hope to get a little time to operate for a while.

Today a friend came over and we did some wheeling and dealing. Anyway, I bought a whole bunch of new junk for me that I did not need. There is even a loose coupler that is about 4 feet long. I got a bunch of QSL cards and log books from the 20's, 30's & 40's. A nice early commercial breadboard crystal set and a bunch of other stuff including a Clapp Eastham spark key. The item that makes me write is made by the subject name, also known as "Radio Constructors Corporation" of Oakland, CA. It is a one tube tuner of some sort, but, I have been unable to locate any information on it. While searching on the web, I came across a copy of a 1928 magazine for which I am enclosing the link. I am sure some of you will enjoy it. I promise some photos soon. 73 - Mike

Tom,

Anything can be used on the CX, including modern, solid-state gear. The score is determined by multiplying the number of QSO's you have by the total age of all of the equipment you get on the air for three or more QSOs during the CX. We don't count the age of accessories such as keys, vfos or operators in the age multiplier. So your HQ-170 which came out in 1968 and your DX-60 which came out in 1960 would give you an age multiplier of 43 + 51 = 94 years. (We multiply the age of a transceiver by two when calculating the age multiplier.) We generally count the age of a piece of gear from its first appearance in an advertisement, or from it's dating in a reliable source such as the Communications Receivers and Transmitters, Exciters and Power Amplifiers books by Raymond Moore. Home brew gear is counted by the date of a published construction article if there is one, by the date when it was built of course, or by any other reasonable method. In the case of my reconstructed 6AG7/6146 Novice Transmitter, I'm dating it to 1952 when I built the first one.

I hope you made it on the air for the CX. I made 12 contacts on 20 meters in 50 minutes of operating, and I qualified four transmitter/receiver pairs there. I made 22 contacts in two hours on 40 meters and qualified another four t/r pairs. And I made 32 contacts on 80 in four and a quarter hours and qualified yet another four pairs. I'm in New Mexico, and I worked stations in MN, OR, OH, NY, TX, WA, CA, NJ, CO, MI, NC, PA, AZ, NV, TN, and NE. So there was a good amount of activity all over the country.

The Phone version of the CX comes up on Sunday, February 13. Both AM and SSB stations will be participating. Get your DX-60 on and have some fun.

73,

Jim, W8KGI

1865. '29 panel materials

Yahoo group: AWAGroup (2010 — 2011)
Date: 2011-01-31 22:06:43 UTC
From: N1BUG
Topic: 1865 Message: 1865

I've "absorbed" much information from the online QST archive and other sources, but I'm left with some nagging questions. Here's one:

Although most of the simple transmitters of the 20's didn't use front panels, some of the more complex ones did, usually painted(?) black or some dark color. Rarely, however, can I find any mention of what material was used for panels. Thin boards? Plywood? Aluminum? Bakelite? Something else? If anyone can shed light on what was used back then, I would appreciate it. (I'm not saying I intend to use a panel, but I'd like to understand what was commonly used at the time before I decide one way or the other)

It occurs to me I never really asked about sources of parts for my 1929 build. Are there any besides these three?

1) swap meets
2) Play Things of Past
3) eBay

Swap meets are not an option, which leaves me with two. Did I miss any? I'm attempting to gather as many of the parts as possible while I still have the time and something of a budget for it.

First hard rubber then Bakelite began to be used around the mid-20s.

There was a long article in QST written by an engineer employed by a hard rubber manufacture comparing HR & Bakelite. Forgotten the issue, but maybe someone can lead Paul to it.

I've "absorbed" much information from the online QST archive and other sources, but I'm left with some nagging questions. Here's one:

Although most of the simple transmitters of the 20's didn't use front panels, some of the more complex ones did, usually painted(?) black or some dark color. Rarely, however, can I find any mention of what material was used for panels. Thin boards? Plywood? Aluminum? Bakelite? Something else? If anyone can shed light on what was used back then, I would appreciate it. (I'm not saying I intend to use a panel, but I'd like to understand what was commonly used at the time before I decide one way or the other)

Thanks Lou! I must have missed that article, maybe I didn't read back far enough (yet).

Aside from general educational value (which is good!), I suppose I don't really need the article, since neither material would appear to be available today. :-)

Paul -

McMaster-Carr has a material called Garolite which "looks" a lot like
the old Bakelite panels. You can even get it with copper on one side,
which works great for regen receivers to minimize 'hand capacity'
effect. mcmaster.com

"Bakelite"* in black is still being produced in sheets and tubing. Sheets available 3/16" thk. glossy both sides. That is, perfect for OT panels in every way. Yet, finding it scratch free masked both sides is a problem. It could be done, but it would take detective work... Lou

I've seen it in polished form. A friend built a complete station with it, and all polished Garolite.

Looked just like Bakelite. This will be a first for me then. I have seen polished Garolite and it always looks like polished Garolite not gloss Bakelite.

Garey, do you want a piece of the Bakelite that I have for comparison? If the two surfaces do compare favourably, please ask your friend to tell us all how he achieve it. Garolite is easy to get...

1879. Cardwell variable condenser

Yahoo group: AWAGroup (2010 — 2011)
Date: 2011-02-05 19:40:37 UTC
From: N1BUG
Topic: 1879 Message: 1879

Hi folks,

Here we go again. I almost hate to ask... but... I ran across another Cardwell condenser which I am trying to date. I've not seen any quite like this before. Here are some photos of the item in question:

http://www.n1bug.com/cc.shtml

Most of its parts and construction look (to this observer) identical to the Cardwell Type B... except for the taller end plates, the two additional insulators, the side mounted panel, and the worm drive! I'm not sure what the insulating material is.

Can anyone shed any light on this one, or more to the point, when it may have been in production? The only thing I know for sure is that this specific unit was manufactured in or after 1927... :-)

I doubt if Ralph shined them up. He really did not have that much interest in vintage ham stuff. I was at his place several times, as he was at mine. If anything, the current seller maybe shinned them up. Also, the output coupling coil is obviously recent as well as another wire by the binding posts. Ralph had a lot of stuff and I do not doubt that it came from his estate, but ,I guarantee that he did not build it, or even modify it. Heck, he could barely keep any of his rigs on the air. Even the modern ones, or the ones from the 50's and 60's. The tube is a 203A and not a 211. I bet that the majority of it is all original. I saw it when it first popped up a day or so ago, but, have no real interest. So, the bottom line is, in my opinion, someone did build it in the real late 20's. 73 - Mike

It looks to me like the connectors hooked to the variable condensor are crimped ,not soldered . also they look more like aluminum than plated steel , have a couple of hindred that look just like them in a box here I bought a couple of years ago , but would love to have those Beehives . Ken ,K7EMO

Hi Lou,

Flip it over, & take a look at any & all inscriptions on the backside...many times you'll find the specific part number & manufacturer's name there.

If that doesn't work, rotate the dial through its entire travel, & watch all three "read-out" windows for any fine-print there...

It's a Marko dial.
Marko brand dials and knobs usually have a small circle with an M inside
some where on the back side. I guess it's their trademark.

1898. W1HRX on the CX and the AWA AM QSO Party

Yahoo group: AWAGroup (2010 — 2011)
Date: 2011-02-10 00:00:43 UTC
From: JAMES HANLON
Topic: 1898 Message: 1898

Y'all,

I've just been tuning up my National NTX-30 transmitter and NSM modulator for the AM portion of the Classic Exchange on Sunday, February 13 and for the AWA AM QSO Party on Saturday/Sunday, February 19 and 20. The NTX-30 is a special rig. According to Bill Fizette, W2DGB, who passed it along to me, "The transmitter was originally owned by O. Eugene Sims, the personal assistant to James Millen at both the National Company and at the James Millen Company. It was acquired by collector John Nagle, and then in turn by Wm Fizette, then K3AJW (later W3DGB)."

I have the NTX-30 running on 20, 40, and 80 meters at this point. I just plugged a "new" (actually well used) 6L6 into the 20 meter doubler socket and tweaked the doubler tank tuning, and I'm getting 24 watts of well-modulated AM signal out on 20 meters. When I drive my Heath SB-200 with the NTX-30, I get about 130 watts of carrier out on 20. On 40 and 80, I'm getting nearly 200 watts of carrier out with the help of the SB-200. So I should have a decent AM signal on from New Mexico for both contests.

I will be signing my own call, W8KGI, for the Classic Exchange, and the James Millen Society club call, W1HRX for the AWA party. W1HRX will be the "Southwestern Flagship Station" for the AWA. And of course it is Jim Millen's old call.

Please try to work me during the CX and the AWA AM QSO Party. I have plenty of QSL cards, both W8KGI and W1HRX, for anyone who would like one. I currently plan to be around 14286 on 20, around 7290 on 40, and around 3880 on 75.

Thanks, 73, and hope to see you on the air,

Jim Hanlon, W8KGI

GM Ken & sorry for the late reply.

VA3AWA does not have a web site, but that's an idea.

Why not think of it as a Wedemeyer Hartley using those Premier's to best layout/mounting advantage. The Kelley will be here and you'll still be looking for those Type DX.

You'll like the TPTG. Good sig and best of all, another dial to turn!

Gud luck with the parts search. Mostly about patience. 73, Lou

P.s., Ur surname spell checks out as Wild-Eyed. Fitting, considering our game...

Well Lou ,my Three favorite websites are "W0VLZ" " VE7SL" & VA3AWA , , I am about half done building my Hull Hartley . 1918. the Cardwell laboratory balancing condenser

Yahoo group: AWAGroup (2010 — 2011)

Several folks were curious about my findings regarding the subject condenser. It arrived today, so here's a preliminary comment or two.

This is the item in question:

http://www.n1bug.com/cc.shtml

This has 35 plates, which I believe to be of the same size and spacing as the Cardwell Type B, so I'm guessing it is about 700 uufd. I have no means of measuring it to confirm.

The worm drive is 100:1 so it would produce a nice slow tuning rate of approximately 6.5 degrees of dial rotation for a frequency shift of 1 kHz at 3.6 MHz when used in a TNT transmitter. That's much better than approximately 67.5 kHz for the same 6.5 degree rotation using a 500 uufd condenser with no vernier!

The worm drive does have several degrees of free play, so there would be some "dead space" when reversing the direction of tuning. That in and of itself shouldn't be too troubling.

The greater concern is backlash, of course. I have no means of assessing this, other than to try it in the TNT mock-up when I get it built. It'll be a while yet, as I'm still gathering parts.

I still think it's ugly (appearance) but will probably use it if nothing more appealing to the eye turns up prior to the build. :-)

1920. Straight line frequency, wavelength condensers?

Yahoo group: AWAGroup (2010 — 2011)
Date: 2011-02-14 22:15:27 UTC
From: N1BUG
Topic: 1920 Message: 1920

I read something which suggested there was a difference between straight line frequency and straight line wavelength variable condensers. I don't remember where, and can't find it again. My mind insists they should be the same thing. Am I wrong?

Does anyone have any information or references on the various plate shapes for these types? I see a lot of different plate shapes. Perhaps some are real SLF and some quasi-SLF? Or ???

Use the condenser without the drive. When tuning a transmitter rapid change is required to quickly locate a dip, even if the condenser is located on the "load" side of the tank. Key down, draws high current from an out of resonance condition, less of that, the longer the tube will last. Some tubes are quickly destroyed if even overloaded for more than a few seconds.

Contoured condenser plates are more suited for receivers where they create a greater separation of frequency at the lower wavelengths.

A multi-band transmitter where the same condenser is used "could" benefit from the design, however, I have never seen such used.

For '20's homebrew transmitters suitable for low power use of salvaged TRF radio condensers are fine. Better choices are those with ceramic in the design.

You will have a lot more fun lashing up what you can find from salvaged or "begged" parts than going into a "replica" design. There is no such thing as an authentic homebrew to copy from. Just keep parts from 1930+, out....

"try it in the TNT mock-up when I get it built"

A snowy afternoon's work, on the air after supper....

Hi Paul - No, they are not the same. Since frequency and wavelength are inversely related, a SLF condenser cannot be the same as SLW. The shape of the plates will be different for each case - a SLF condenser will tune linearly as reciprocal of wavelength, and vice-versa (look at the graph of y=1/x).

Paul,

National offered Straight Line Wavelength, Straight Line Capacity, and Straight Line Frequency variable condensers as the attached page from the 1938 ARRL Handbook, catalog section shows. Note that the rotor on the Straight Line Wavelength and Straight Line Capacity units turns through 180 degrees while the rotor on the Straight Line Frequency unit turns through 270 degrees. They also made a Straight Line Frequency condenser that turned through 180 degrees which was used in the main tuning condenser in the famous National HRO receiver.

Thanks. There's an interesting point I had overlooked! In a TNT transmitter I can see that being a sticky problem during initial adjustment, while trying to locate the dip and modify the grid coil to move said dip (if necessary).

Getting the drive off could prove interesting. I had assumed the set screw was holding it to the shaft, but it is also pinned.

My subsequent question about SLF, SLW condensers was related to a receiver project.

Plenty of snowy afternoons lately! I'm still missing a couple of "must have" parts for even a rough mock-up, but they will turn up somewhere.

I have to disagree with this. First of all, the TNT circuit Paul will be
building has a very broad dip in the plate tank because of the low-Q grid
circuit. And you want fine control of the capacitance because this is how
the transmitting frequency is set. With a Hartley there is no dip - the
single tank circuit controls the transmit frequency.

Secondly, many high-power tube-type RF anplifiers successfully use vacuum
variables with turns-counting dials in the Pi network plate tank circuits
both on the plate and load sides, and these are typically 10+ turn
capacitors which change capacitance rather slowly. The trick is to begin
tune-up at reduced power, or have a log of pre-sets, or both.

I would definitely use the reduction drive, I see it as a necessity to get
the rig on frequency, unless an electrical bandspread control is added.

> Contoured condenser plates are more suited for receivers where they create

True.

>

Yes, but you definitely want some sort of precision reduction drive on the
capacitor controlling the transmit frequency. Take it from someone who
built and uses a TNT without this "luxury."

I definitely agree with this. Otherwise, all the time and effort goes into parts procurement instead of building and using the rig. OT hams used whatever they could get their mitts on, and most weren't well-off or patient enough to exactly duplicate a (typically no-expense spared) ARRL design with newly-purchased parts.

> "try it in the TNT mock-up when I get it built"
>

1933. Hartley power supply question

Yahoo group: AWAGroup (2010 — 2011)
Date: 2011-02-17 13:44:20 UTC
From: Terry Hall
Topic: 1933 Message: 1933

Hello group,

I've been working on my plate power supply for my Hartley. I am using a Radio Shack 110 to 220 step up transformer as my base and have built a converter using a bridge. This is a first time project for me.

The unit tests ok, but I one thing that concerns me is that the DC output voltage is 350 volts. I was expecting a direct conversion from AC to DC at about 240 volts.

Question: Is this the peak voltage and will the voltage drop once I put a load to it? A friend of mine suggested that I am measuring peak, and I will pull only about 50 Ma.

I am afraid that I will blow up the 327 tube if I use the supply as is. Am I correct?

Any help as to how to get this voltage down would be helpful. I will try to post a photo that I have on the group site.

Hi Terry,

You really don't want to put more than 250 VDC---MAX!---on the plate of a '27...

I'm sure the voltage will drop some, under load, but hardly near that 250 mark,

Try employing CHOKE input in your power supply, vs. capacitor input---that'll drop the voltage. And if that isn't enough, you may well have to employ a voltage dropping resistor in series to the '27...

If you figure on a current draw of 50 ma. (0.05 amperes), then the value of this resistor would be computed thusly:

---Take your actual DCV (350) minus what you want it to be (240), or, 110 V...

---Resistance needed equals voltage divided by current, or, 110 / 0.05 = 2,200 ohms...

---The power rating of this resistor is current (squared) times the resistance, or, (0.05 x 0.05) x 2,200 = 0.0025 x 2,200 = 5.5 watts...but for the matter of safety, go to at least a 10 watt resistor.

There---how'd I do with my algebra, all you flamers out there...?!

Hi Terry:
What you are seeing is the DC peak voltage which is around 1.4 times the output rating on the transformer. As soon as you start putting a load on it the voltage will drop. I usually put a bleeder resistor across the last filter cap both for safety (discharge the filter capacitor) and to provide a minimum load for the power supply. I shoot for about a 10 milliampere load so with your peak of 350 volts the resistance should be R=E/I = 350v/.01amp = 35,000 ohm resistance. A five-watt, 33,000 ohm resistor would work well. Remember that these voltages can kill so be sure the plate voltage is at *zero* before you stick your fingers into anything.

1939. Re: [AWA Group] Hartley power supply question

Yahoo group: AWAGroup (2010 — 2011)
Date: 2011-02-17 16:38:38 UTC
From: N1BUG
Topic: 1933 Message: 1939

I would add a choke must be a certain minimum value to hold the voltage down. This value is called critical inductance and may be calculated by:

Lcrit = load resistance/1000

For 220V at 50 ma the load resistance is 220/.05 = 4400 ohms, divided by 1000 = 4.4 henrys. Any choke larger than that should hold the voltage down to average when under load.

Note however that when you are not drawing current, voltage will still soar toward peak. In order to keep the voltage down to average all the time with a choke input filter, you must draw some current at all times (eg. by use of a bleeder resistor) and size the choke accordingly.

Let's assume we use a bleeder that will draw 10 ma. This would be 22000 ohms for 220 volts. Now to maintain voltage regulation we calculate Lcrit based on 10 ma: (220/.01)/1000 = 22 henries.

Not however that with a properly designed choke input filter you will probably see a DC voltage approximately 0.9 times average or RMS AC voltage, or in this case 220 * .9 = 198 volts.

You must have a capacitor-input filter. With this filter the no-load
voltage will be the peak value, = 240V x1.4 = 336V
>
> Question: Is this the peak voltage and will the voltage drop once I put a

Yes. But it probably won't drop all the way to 240V.

> I am afraid that I will blow up the 327 tube if I use the supply as is.
> Am I correct?

Hard to say - the tube may take it, but I wouldn't chance it, since they
aren't making any more Cunningham 327s these days.

>
> Any help as to how to get this voltage down would be helpful. I will try
> to post a photo that I have on the group site.
>

You could go with a choke-input filter, but finding a suitable choke may
be problematic, and its minimum inductance value is somewhat critical and
will depend on total load current (bleeder + Hartley). With the proper
value of choke, the output voltage would nominally be 240 V x 0.90 = 216V,
in reality a bit less from IxR losses.

A better solution might be to run the plate supply you've built with a
Variac or equivalent on the primary of the plate xfmr.

Or, you could eliminate the filter entirely and have your signal modulated
by 120Hz, but that might upset some of the rule enforcement enthusiasts at
the FCC ;-)

I get that advice a lot. It's good advice! I'm not the most well-off or patient person around, but I sure can be stubborn! :-)

I didn't really offer much introduction when I first checked in here looking for help and advice, but since I haven't yet been slapped for excess verbiage or over-posting, here's my story.

I fell in love with those late '20s rigs from QST 30 years ago, during my early days in the hobby. There's just something about their appearance that captured my eye and imagination. I never really thought about building one until recently, when a friend told me there are people still using such rigs on the air. Say what?! He told me about the Bruce Kelly event and I knew right away I was in big trouble! Hearing a few '29 rigs on the air in the Linc Cundall further cemented the plan, not that I needed it at that point... I was already firmly hooked!

I have put considerable thought into what I want to do. I plan to do something unusual, or at least something I haven't seen examples of yet. My goals are pretty solidly defined (in my feeble mind) as follows:

Capture the essence of the '29 QST rigs appearance, but not to duplicate a QST rig exactly;

Use only authentic '29 or earlier parts wherever possible;

Make it unique by changing some mechanical aspects of the design. This probably was never done back in the day, because what I have in mind (if it works out) will actually make the rig more complex mechanically and hence more expensive! I'm not prepared to give away my top secret design ideas just yet <grin>, but I will add I only plan to use techniques that were *known* (even if not generally used in TNT transmitters) in '29.

With regard to the Cardwell laboratory balancing condenser, I've all but completely rejected it based on a few hours sliding parts around the kitchen table! This thing is just not compatible with my goal of maintaining the essence of the '29 QST rigs appearance! Even

without the worm drive assembly, it just isn't right. I will keep looking until I find what I really want. Or until I expire, whichever comes first. :-)

I'm putting blinders on for now, while I find a way to refinance this project. I need someone to install parental controls on my computer so I can't get to eBay! But I'll be back on the hunt as soon as possible!

I really appreciate all the help and great advice I have received from this group!

Put a bleeder resistor from the output to ground. A good starting point would be to have the bleeder draw about 10 percent of the expected load current. Then go to a choke-input filter if the voltage is still too high. Besides a choke-input is better when you use CW.

Terry,

I find that transmitters like the Hartley oscillator are fairly sensitive to operating conditions. Certainly changing antenna load will shift the frequency. Depending on your transmitter design and how you tune it, changing B+ will also shift your frequency. A fairly stiff B+ supply as you key the transmitter will help frequency stability.

With my TNT and Hartley transmitters I've regulated the B+ and put the power supply out of sight. Depending on your '27 current requirements, the right dropping resistor along with a couple of VR tubes in series to regulate your power supply to 250V may all you need.

Niel - W0VLZ

Terry,

Neil, W0VLZ, suggested that you regulate the voltage for your Hartley, a suggestion that I heartily second. I use an old Lambda regulated power supply on my Hartley, and the note has no chirp. If your power supply voltage bounces when you key your rig, you are likely to get considerable chirp out of it.

Neil suggested that you use a couple of VR tubes in series to build up to the voltage you desire. That's a good idea, but it will limit the amount of current your rig can draw to about 35 ma max without extinguishing the VR tubes and losing your voltage regulation. The larger, Octal VR Tubes (OD3/VR-150, OC3/VR-105, OB3/VR-90 and OA3/VR-75) are rated to sink 40 milliamps max, and they need to conduct about 5 ma to stay lit, so that gives you a range of 35 ma to work with. That's not a bad limitation when you consider the advantage that regulated B+ will give to your signal.

On the other hand, a chirp can make your signal unique and easy to recognize.

Have fun!

Jim, W8KGI

Yes it is. At one time I had a large rack with 3 or 4 units in it. One was a power supply, one was this transmitter and I believe one was an amplifier and another a modulator. I may be wrong about the modulator. I do not remember if I got rid of it, or, if it is still helping to hold the basement in place, HI. 73 - Mike

Paul -

Do you have an ultrasonic cleaner? I have found that was the best way to clean all vintage parts and items. You have to find the proper concoction to use depending on the metal characteristics, and, watch the time. In fact, just try it for real short time to begin with and see how it goes. They do an amazing job and can be found inexpensively. 73 - Mike

Folks have reported good luck by boiing in water with a bit of lemon juice
(for its citric acid), or by running through a dishwasher cycle.

I think if these are old caps with hard rubber parts, the temperatures
invovled in the above might cause problems.

With either method, the bearings or bushings should be re-lubricated after
cleaning.

I've never tried either method, so can't vouch for one or the other.

Hi Guys,

I've tried hese two relatively easy methods of cleaning air variables, with the following results:

(A) Boil them in water laced with lemon juice...it works. alright, but the acid can "plate" the otherwise "white" metal parts of your cap with a nice copper sheen, if your cap has any plates made of that latter metal! It'll also RUIN the pot you're doing the boiling in.

(B) Place them in the automatic dishwasher...probably the best method I've ever used, by far---only do NOT leave the caps in the machine for the heated dry cycle! (it can wreck any ceramic components, if any, in the cap).

With either method, you'll have to re-lube the cap's bearings---I've found that a drop, or two, of ordinary castor oil works very well here...

Automatic dishwasher, take them out before the heat kicks on.

The words "Common Sense" are the rule here.

Works great on R-390A RF gear trains as well!

Works super on Collins 30K RF output networks, photos below.

Thanks everyone, for the interesting discussion on cleaning these things.

There were several "votes" for the automatic dishwasher, and Bruce's pictures were very interesting. Unfortunately, no automatic dishwasher available.

I still have some time while hunting for other parts needed, so I will contemplate this further before attempting to clean my new prizes! These are vintage parts with hard rubber.

Hi,
The dishwasher is definitely the way to go. A short time in an oven is to be recommended to drive any left over moisture out of the nooks and crannies. I use about 150 degs. F for 10 minutes....give or take. I use a tiny drop of machine oil at any rotor contact with the frame; 3-in-1, reel oil they don't gum up.

1975. Tube Sockets 101 ?

Yahoo group: AWAGroup (2010 — 2011)
Date: 2011-03-06 17:14:44 UTC
From: N1BUG
Topic: 1975 Message: 1975

It has been very quiet here lately.

Anyone care to offer a bit of elmering on tube sockets? I took this item for granted early on and didn't research heavily. In hindsight that was a mistake, so I'm now trying to get up to seed on understanding tube sockets!

For now I will be using UX-201A tube(s) in my transmitter(s), but hope to be able to upgrade to UX-210 or UX-245 someday.

A few questions which I've not been able to find answers to:

Are 'Air Gap' sockets so popular because they look great, or is there another reason to prefer them?

Are all 'Air Gap' sockets the same, or were there different types?

Are "springy" type tube sockets unwise for use in transmitters?

Any other advice, warnings, anecdotes, or educational material will be most welcome, of course!

73,
Paul

Hello Paul,

A few questions which I've not been able to find answers to:

Are 'Air Gap' sockets so popular because they look great, My take? Yes! and the ARRL featured them in their beginners rig projects. or is there another reason to prefer them? "It gets that last mile." See below.

Are all 'Air Gap' sockets the same, or were there different types? There were at least two versions. As far as I know the one shown below was never advertised in QST.

Are "springy" type tube sockets unwise for use in transmitters? "springy" will add character to ur sig, but it will have enough of that already I'm sure.

73, Lou

Is that the reason you 'almost' made it back here on our last try??....had you used those sockets I would no doubt have easily heard you. To think that your signal was just 1 mile to the east of me at the time..darn.

Actually, it may have LESS character with the springy socket. These things
were used to reduce acoustic coupling to the often-microphonic detector
tube in receivers. So your transmitter tube(s) may not pick up your key
banging on the table, or the XYL walking across the floor upstairs (but
your tank circuit probably will!). In theory, anyway.

That's one rational, but the early mags always say do not use cushioned sockets. Maybe Paul could try with and without springy and write a paper on the results? Lou

Thanks Larry and Lou.

Why not? I will add that to my list of experiments to try with the experimental version of the rig prior to final build. Assuming I come up with a non-springy socket before then, which I'm sure I will. I don't particularly care for the appearance of the springy sockets I have but if they remove character from my signal I may convince myself to use one in the permanent version. There's enough "character" around this place already! ;-)

Paul,

While they look great, I tend to avoid the bayonet/twist-in sort of tube sockets. I hate to torque on the glass to get the tube in and out of the socket...I'm afraid I'll break the glass loose from the tube base.

I've just used the push-in, non-springy sockets that grip tube pins on the sides. See
http://4.bp.blogspot.com/_svHaMoEDgIg/Sym84-aVJ4I/AAAAAAAAAQE/j_64ZSOPIx0/s1600-h/DSCF5922a.JPG
Pilot and others made them in the 20s.

Thanks Niel,

I had wondered about that with the bayonet sockets, but never having used one I wasn't sure how much force is required.

I had been looking for something rather specific, but think I will back off a little on my desires. Getting too close to let one item delay the build.

Nice rig!

From: Jim Robson
Topic: 1994 Message: 1994

Good evening, AWA Group Colleagues--

I am new to the group; I hope you will forgive my lack of protocol.

Members have been most helpful during the course of my recent restoration of a Hallicrafter's Super Defiant. I intend to earn my amateur radio license this summer and look forward to communicating via 'cw'--the appropriate way!

A favour for a new-ish guy?--I have an Atwater Kent Model 10 in my collection for which I have been looking for an on/off switch for a long, long time. As it happens, one has turned up on ebay but the seller only ships to a US address.

Here is the link:
http://shop.ebay.com/i.html?_nkw=atwater+kent+switch&_sacat=0&_odkw=morse+code+key&_osacat=0&_trksid=p3286.c0.m270.l1313

Would a US ebay client/AWA Group member consider bidding on this item for me, I would be most pleased to compensate them.

Thoughts?
With respect,
Jim Robson.

Hi, Jim. Regarding your Hallicrafter's Super Defiant, did you have any porblems with the local oscillator? I couldn't get mine to work above 12 MHz when I first started working on it. I noticed a muddy looking film covering the components under the chassis and figured it must have been under water at one time. After cleaning as best I could, it came up to about 20 MHz. Baking with my heat gun brought it up to about 32MHz. All appropriate components were replaced and it was realigned but it won't go any higher. What it does cover, it does very well. I was just wondering if you found anything else that could be contributing to the problem.

Leonard

Well, sir, that's an excellent question. In my opinion, and my experience, there is a straightforward way to go about this: with respect, do you have a schematic? After sixty years, all kinds of spontaneous repairs are accumulated in your radio. And neglect. Replace all capacitors with the manufacturer's specified value. Replace all resistors. Return modifications to the factory spec's. Crystal seems to be constant but it can vary a bit if you are a discriminating listener. The 'q' of i.f.'s and so on can change over years--be prepared for an alignment. After all that, try a number of different oscillator tubes. That is a common problem to tube manufacturing of the era--some tubes would not oscillate or would oscillate poorly--especially on the higher bands. I would be very interested to know how you make out. It's a good receiver. Jim.

Want to buy some Miller IF transformers and parts for an HBR receiver project. I'm looking to build an HBR-13 from scratch. Would you please look in your junk box and help me out?

(2) Miller 1730 1800 Kc IF transformer
(4) Miller 1709 or 1710 10 KC IF transformer
(1) Miller 1711 100 Kc BFO

Eddystone slide rule dial
National HRO gear box that is inline rather than right angle
BC453 radio or ARC5 R23 190 Kc - 550 Kc receiver
Junker or uncompleted HBR receiver for parts

Thanks very much! 73, Scott WA9WFA

Thanks, Jim. I've done all the regular things, and even rewound one of the coils. The weak link seems to be the 6K8 tube. I went through my stock of 6K8's and got varying results with different tubes. Even considered changing the circuit to take a different tube, but I hate to modify a radio when I only have one of that model. I'll probably not do anything more to it since there's not much to listen to between 30-42MHz anyhow.

Hi Scott,

Kudos to you for daring to "...go where few have gone before" by your wanting to build a superhet receiver...!

Your "wish list" for unobtanium is---unfortunately!---destined to remain just that for the most part, i.e. a "WISH" list...so you may well have to do some creative PARTS homebrewing on more than a few of those goodies that you're seeking...

In all probability the IF tranformers are the best candidates for homespun creativity---and here's a website that might inspire you along that very line:

http://www.angelfire.com/electronic/funwithtubes/IF_Can-1.html

Have a look-see, & use it only of necessary...and in the meantime, do please remember that collecting components for an elaborate project such as this can be half the fun of same!

~73!~ de Eddy VE3CUI - VE3XZ

Subject: [AWA Group] Wanted: Miller IF Transformers and Parts for Receiver Project

Want to buy some Miller IF transformers and parts for an HBR receiver project. I'm looking to build an HBR-13 from scratch. Would you please look in your junk box and help me out?

(2) Miller 1730 1800 Kc IF transformer
(4) Miller 1709 or 1710 10 KC IF transformer
(1) Miller 1711 100 Kc BFO

Eddystone slide rule dial
National HRO gear box that is inline rather than right angle
BC453 radio or ARC5 R23 190 Kc - 550 Kc receiver
Junker or uncompleted HBR receiver for parts

Thanks very much! 73, Scott WA9WFA

Hi Scott,

Ludwell Sibley has a good idea: use ARC-5 parts for your superhet. I did that with one of my ARC-5's and it worked (surprisingly) quite well. I changed the RF & Osc coils to BCB coils, replaced the tubes with 6v tubes, and replaced the mixer with a 6D10 in a Pullen circuit. The hardest part was getting it to track properly for the 85 KHz IF coils. I did the same thing with an S-20R parter, using a 7360 beam mixer, with less than startling results. I'll work on it some more some day. Another posibility is to scour the Goodwill stores for old tube type radios.

Leonard
